UNIX essentials (hands-on)

- overview: **`Unix, tcsh, AFNI`**
- the directory tree
- basic shell commands (class practice)
- running programs
- the shell (using the T-shell)
  - → command line processing
  - → special characters
  - → command types
  - → shell, array and environment variables
  - → wildcards
  - → shell scripts
  - → shell commands
  - → pipes and redirection
- OS commands
- special files

- **Overview: Unix, T-shell, AFNI**

  → **Unix**

  - a type of operating system (a standard), first developed in 1969
  - examples: Solaris, OpenSolaris, Irix, AIX, HP-UX, OS X, Linux, FreeBSD
    - actually, Linux and FreeBSD are not Unix compliant, but are very similar
  - has graphical environment, but a strength is in command-line capabilities
  - hundreds of commands, minimum, thousands on most systems

  → **tcsh** (T-shell)

  - a Unix shell: a command-line interpretter
    - when user types a command and hits ***Enter***, the shell processes that command
  - just one of the common Unix programs (a single file: /bin/tcsh)
  - other Unix shells: sh, bash, csh, ksh, zsh
  - has own syntax and sub-commands
  - not as powerful as bash, but more simple and readable

  → **AFNI**

  - a suite of data analysis tools
  - more than 600 programs, scripts and plugins
  - free and open source

- **Overview: Unix, T-shell, AFNI** - separate commands and syntax

  → **Unix** : sample commands and syntax
  - commands: **ls, cat, less, mv, cp, date, ssh, vi, rm**
  - syntax: variables (**$**), quotes (**', ", `**), wildcards (***, ?, []**), pipes (**|**), redirection (**>**)
  - comments: part of any Unix-based system (e.g. **Solaris, Linux, OS X**) command help from '**man**' pages (or a book), e.g. **man less**

  → **tcsh** (T-shell) : sample commands and syntax
  - commands: **cd, set, setenv, if, foreach, alias, history**
  - syntax: home directories (**~**), history (**!**), jobs (**%**), redirecting **stderr** (**>&**)
  - comments: single installed program, command help from '**man tcsh**' (or a book)

  → **AFNI** : sample commands and syntax
  - commands: **afni, suma, 3dcalc, afni_proc.py, 3dDeconvolve**
  - syntax: sub-brick selection (**[$]**) - note: these characters appear elsewhere
  - comments: installed suite of programs, command help from -help output
    e.g. **afni_proc.py -help**
    e.g. **afni_proc.py -help | less**

- **The Directory Tree** (the organization of the file system)
  - → directories contain files and/or directories
  - → **`/`** : means either the root directory, or a directory separator
    - consider **`/home/afniuser/AFNI_data6  FT/SUMA`**
      - getting to **`FT/SUMA`** requires starting from **`AFNI_data6`**
  - → an "absolute" pathname begins with '**`/`**', a "relative" pathname does not
    - a relative pathname depends on where you start from
  - → every directory has a parent directory
    - the relative pathname for the parent directory is '**`..`**'
      - what does "**`cd ..`**" do?
    - the relative pathname for the current directory is '**`.`**'
      - what does "**`cd .`**" do?
    - consider "**`./run_this_script`**", "**`cp ~/file .`**", "**`ls ../afni_handouts`**"
  - → many commands can be used to return to the home directory (of "**`afniuser`**")
    - **`cd,  cd /home/afniuser,  cd $HOME,  cd ~,  cd ~afniuser`**
      - note the 2 special characters, '**`~`**' and '**`$`**'
  - → while you work, keep your location within the directory tree in mind

Basic Shell Commands: open a terminal window and practice

1. Upon opening a new terminal window, what directory am I in? (**pwd**)
2. Approximately how many files and directories are here? (**ls, ls -l, ls -a**)
3. How big are these programs (as files): tcsh, afni, .cshrc, s15.proc.FT.uber?

   ls -l /bin/tcsh, ls -l abin/afni, ls -l .cshrc,

   cd AFNI_data6/FT_analysis, ls -l, wc s15.proc.FT.uber
4. The last 2 are actually scripts, look at them. (**cat, gedit, nedit**)
5. What polynomial order is used for the baseline in 3dDeconvolve in s15.proc.FT.uber?

   Search for "polort" in the 3dDeconvolve command. (**less s15.proc.FT.uber**)

   (consider keystrokes in **less**: ***Enter, Space, b, g, G, h, /, n, N, q***

   --> down line, page, up page, go to top, bottom, help, search, next, next-up, quit)
6. Why are the line continuation characters ('\') useful? (**less s15.proc.FT.uber**)

   --> for readability, note: must be LAST character on line
7. How many runs are processed in the **foreach run** loops? (find "**set runs =**")
8. What are the arguments to the **within()** function in **3dcalc**?

   3dcalc -help | less (use '**/**' and '**n**' to search for occurances of 'within')
9. If we run **afni**, how can we still type commands (without opening another terminal)?

   (**ctrl-z, bg**) (also try: **afni &**)

- **Running Programs**
  - → a program is something that gets "executed", or "run"
  - → the first element of a command line is generally a program (followed by a space)
  - → most shells are case sensitive when processing a command
  - → command examples (options usually start with a '**-**') :
    - **/bin/ls $HOME/AFNI_data6**
    - **count -digits 2 1 10**
  - → script: an interpreted program (interpreted by some other program)
    - e.g. shell script, javascript, perl script, afni startup script
    - recall: **less ~/AFNI_data6/FT_analysis/s15.proc.FT.uber**
  - → create a script (text file) containing a few commands: (**gedit my_script.txt**)

```
echo “hello there”
ls -a
count 7 11
```

  - → execute the script in a few ways

```
tcsh my_script.txt
bash my_script.txt
./my_script.txt
chmod 755 my_script.txt
./my_script.txt
```

<--- script should start with '**#!/bin/tcsh**', for example

- **The Shell** (focusing on the T-shell)
  - → a shell is a command interpreter (case and syntax sensitive)
  - → examples: **tcsh, csh, sh, bash, ksh, zsh, wish, tclsh, rsh, ssh**
  - → command: **`echo $0`**
  - → the T-shell**: `/bin/tcsh`**
    - an enhanced C-shell (**csh**), which has C programming style syntax
- **Command Line Processing** (simplified outline):
  1) evaluate special characters, such as: **`~ $ & * ? \ ' " ` |`**
  2) decide which program to execute (more on this later)
     - absolute pathname? alias? shell command? in the **$PATH**?
  3) execute appropriate program, passing to it the parameter list
  4) save the execution status in the **$status** variable (0 is considered success)

  - → tcsh has automatic filename completion using the Tab key
    - type "**ls suma**" and hit the *Tab* key, watch what happens, and hit *Enter*
    - type "**ls AF**" and hit the *Tab* key, note what happens
    - note: this requires setting the shell variable, **filec**

- **Special Characters** (some of them, and some of their uses)

  ~ : the current user's home directory (e.g. **/home/afniuser**), same as **$HOME**

  $** : used to access a variable (e.g. **$PATH)

  & : used to put a command in the background (e.g. **suma &**)

  ***** : wildcard, matching zero or more characters (e.g. **echo AFNI_da***)

  ? : wildcard, matching exactly one character (e.g. **ls AFNI_data?**)

  **** : command line continuation (must be the last character on the line)

  ' : the shell will not evaluate most special characters contained within these quotes
  (e.g. echo **'$HOME' :** will output **$HOME**, not **/home/afniuser**)
  (e.g. **3dbucket -prefix small_func 'func_slim+orig[0,2..4]'**)

  " : the shell will evaluate **$variables** and **`commands`** contained within these
  (e.g. **echo "[*] my home dir is $HOME"**)
  (e.g. **echo "the numbers are 'count 7 12'"**)

  ` : execute the command contained within these quotes, and replace the quoted part with the output of the contained command
  (e.g. **echo "the numbers are `count 7 12`"**)

- **Command Types**
  - → the shell must decide what type of command it has:
    - pathname for a program: execute that program
    - alias: apply any alias(es) then start over (decide on which program to run)
    - shell command: part of the **`/bin/tcsh`** program
    - check the **`$PATH`** directories for the program
  - → consider the commands:

```
/bin/ls AFNI_data6/afni
ls AFNI_data6/afni
cd AFNI_data6/afni
wc ~/AFNI_data6/afni/epi_r1_ideal.1D
```

  - → the "which" command shows where the shell gets a command from:

```
which ls          which cd          which wc
```

- **Shell Variables: The PATH Variable**
  - → a list of directories to be searched for a given program to be run from
  - → the **`$path`** and **`$PATH`** variables are identical, but are represented differently
    - **`$path`** is specific to **`csh/tcsh`**
  - → commands:

```
echo $PATH
echo $path
cat ~/.cshrc
```

- **Shell Variables**
  - → shell variables are variables that are stored in, and affect the shell
  - → all variables are stored as strings (or as arrays of strings)
  - → a variable is accessed via the '**$**' character
  - → the '**echo**' command: echo the line after processing any special characters
    - command: **echo my home dir, $HOME, holds ~/***
  - → the '**set**' command: set or assign values to one or more variables
    - without arguments: '**set**' displays all variables, along with any values
    - '**set**' takes a list of variables to set, possibly with values
    - consider the commands:

```
set food
echo $food
set food = pickle
echo $food
set food eat = chocolate donut
set
set food = eat chocolate donut
set food = "eat chocolate donut"
echo $food
```

(emphasis: food eat = chocolate donut)

→ variables can be assigned the result of a numerical computation using the '@' command, however only integer arithmetic is allowed

- commands:
```
set value1 = 17
@ value2 = $value1 * 2 + 6
echo value2 = $value2
```

- **Array Variables**

→ array variables are set using **( )**

→ consider the commands:

```
set stuff = ( 11 12 13 seven 15 )
echo $stuff
echo $stuff[1]
echo $stuff[2-4]
echo $stuff[8]
set stuff = ( hi $stuff $food )
echo $stuff
echo $path
cat ~/.cshrc
```

- **Environment Variables**

  → similar to shell variables, but their values will propagate to children shells
  → by convention, these variables are all upper-case (though it is not required)
  → similarly, shell variables are generally all lower-case
  → set environment variables using "**`setenv`**" (as opposed to the "**`set`**" command)
  → without any parameters, the "**`setenv`**" command will display all variables
  → the "**`setenv`**" command will only set or assign one variable at a time
  → the format for the command to set a value is (without any '=' sign):

```
setenv VARIABLE value
```

  - commands:

```
setenv MY_NAME Elvis
echo $MY_NAME
echo $path
echo $PATH
echo $HOME
setenv
```

- **Wildcards**
  - → used for shell-attempted filename matching
  - → special characters for wildcards:

    ***, ?, [,], ^**

    ***** : matches any string of zero or more characters

    (special case: a lone * will not match files starting with '.')

    ? : matches exactly one character

    [] : matches any single character within the square brackets

    [^] : matches any single character EXCEPT for those within the brackets

  - → commands (run from the **AFNI_data6/EPI_run1** directory):

```
ls
ls *
ls -a
ls 8*3.dcm
ls 8*0*3.dcm
ls 8*00?3.dcm
ls 8*00[23].dcm
ls 8*00[^23].dcm
```

- **Shell Scripts**
  - → a text file, a sequence of shell commands
  - → the '****' character can be used for line continuation (for readability)
    - for that purpose, it must be the last character on the line (including spaces)
  - → executing shell scripts, 3 methods:
    1) **`./filename`** : (safest) execute according to the top **"`#!program`**"
       - if no such line, usually executed via **`bash`** (a potential error)
       - the file must have execute permissions (see **'`ls -l`**', '**`chmod`**')
    2) **`tcsh filename`** : execute as t-shell commands
    3) **`source filename`** : execute using current shell
       - affects current environment
       - this method should be used only when that is the intention (e.g. **`.cshrc`**)
  - → recall **`~/AFNI_data6/FT_analysis/s15.proc.FT.uber`**
  - → **create a script (text file) called `my_script.txt` containing a few commands**
  - → recall: execute the script in a few ways

```
tcsh my_script.txt
bash my_script.txt
./my_script.txt
chmod 755 my_script.txt
./my_script.txt   <--- script should start with '#!/bin/tcsh', for example
```

- **Some Shell Commands** (handled by the shell)

  `cd` : change working directory

  `pwd` : display the present working directory

  `set` : set variables or assign string values to variables

  `@` : set a variable to the results of an integral computation

  `alias` : display or create an alias

  (e.g. **`alias hi 'echo hello there'`**)

  `bg` : put a process in the background (usually after ctrl-z)

  `fg` : put a process in the foreground

  `exit` : terminate the shell

  `setenv` : set environment variables

  `source` : execute a script within the current shell environment

- special keystrokes (to use while a process is running)

  `ctrl-c` : send an interrupt signal to the current process

  `ctrl-z` : send a suspend signal to the current process

- **More Shell Commands: basic flow control**
  - → commands: **`if, else, endif, while, end, foreach`**

```
if ( $user == "elvis" ) then
     echo 'the king lives'
endif
```

```
set value = 5
set fact = 1
while ( $value > 0 )
   @ fact = $fact * $value
   @ value -= 1
end
echo 5 factorial = $fact
```

```
foreach value ( 1 2 3 four eight 11 )
   echo the current value is $value
end
```

```
foreach file ( I.*3 )
   ls -l $file
end
```

- **Pipes and Redirection**

  > : redirect program output (**stdout**) to a file

  e.g. **3dinfo -help > 3dinfo.help**

  3dinfo -pickle > 3dinfo.help

  >& : redirect all output (both **stdout** and **stderr**) to a file

  e.g. **3dinfo -pickle >& 3dinfo.pickle**

  e.g. **tcsh my_script.txt >& script.output**

  >> : append program output to a file

  e.g. **echo "remember to feed the cat" >> script.output**

  | : pipe standard output to the input of another program

  e.g. **3dDeconvolve -help | less**

  |& : include **stderr** in the pipe

  e.g. **tcsh -x my.big.script |& tee script.output**

  - run the script (echo commands to terminal before executing)
  - send all output to the **tee** program
  - the **tee** program duplicates its input, sending the output to both the terminal and the given file (**script.output**)
  - you can see the output, but it is also stored for future analysis

- **Some OS Commands**

  ls : list the contents of a directory

  * **cat** : concatenate files to the terminal (print them to the screen)

  * **more** : a file perusal program - view files one page at a time

  * **less** : a better file perusal program (type **less**, get more)

  echo : echo command to terminal window

  man : on-line manuals for many OS commands (and library functions)

  - this uses a "**less**" interface to display the information

  - e.g. consider **man** on : **ls, less, man, tcsh, afni**

  * **head** : display the top lines of a file (default = 10)

  - e.g. **3dinfo func_slim+orig | head -25**

  * **tail** : display the bottom lines of a file (default = 10)

  - e.g. **tail ideal_r1.1D**

  * **wc** : word count - count characters, words and lines (of a file)

  cp : copy files and directories to a new location

  mv : rename a file, or move files and direcotories

  rm : remove files and/or directories (BE CAREFUL - no recovery)

  - e.g. **rm junk.file**

  - e.g. **rm -r bad.directory**

  * denotes a 'filter' program, which can take input from a file or from **stdin**

* **grep** : print lines from a file that match the given pattern

e.g. **grep path ~/.cshrc**

e.g. **ls ~/abin | grep -i vol**

e.g. from the output of "**3dVol2Surf -help**" show lines which contain 'surf', but not 'surface', then remove duplicates:

```
3dVol2Surf -help | grep surf | grep -v surface | sort | uniq
```

- **Some Special Files (in the home directory)**

.cshrc : c-shell startup file ("**csh** run commands")

- set aliases
- adjust the path
- set shell and environment variables

.afnirc : **AFNI** startup file

.sumarc : **suma** startup file

.login : commands run at the start of a login shell (e.g. a terminal window)

.logout : commands run before exiting a login shell

.bashrc : bash startup file (in case **bash** your login shell)
