# UNIX essentials (hands-on)

- the directory tree
- running programs
- the shell
  - → command line processing
  - → special characters
  - → command types
  - → shell variables
  - → environment variables
  - → wildcards
  - → shell scripts
  - → shell commands
  - → pipes and redirection
- OS commands
- special files

### The Directory Tree

- → directories contain files and/or directories
- → /: means either the root directory, or a directory separator
  - consider the directory /home/user/AFNI data1
- → class work:
  - open a terminal window
  - commands: pwd, ls, ls -a, ls -al
  - use the "cd" command to go to the given directories
    - > e.g. for directory /usr/bin, use the command: cd /usr/bin
    - > once there, use the commands "pwd", "ls", and "ls -al"
    - > note that you can always return to the home directory via: cd

```
/, home, user, AFNI_data1, ..., AFNI_data1/afni, .../..
/home/user, /usr/bin, ~/abin, .../.../home/user/.../user/.../user
```

- → many commands can be used to return to the home directory (of "user")
  - examples: cd, cd ~, cd ~user, cd \$HOME, cd /home/user
- → an "absolute" pathname begins with '/', a "relative" pathname does not
  - a relative pathname depends on where you start from
  - in the directories above, note which are relative pathnames

- → every directory has a parent directory
  - the relative pathname for the parent directory is '..'
  - the relative pathname for the current directory is '.'
- → commands:

```
ls, ls -a, ls -al, ls -alt, ls -altr, cd ~/AFNI_data1/afni
ls -l, wc ideal_r1.1D, cat idea_r1.1D, less ideal_r1.1D
```

- → 'less': a file perusal program
  - basic keystrokes while running less: Enter, Space, b, g, G, h, q
  - command: less rall vr+orig.HEAD

### Programs

- → a program is something that gets "executed", or "run"
- → the first element of a command line is generally a program
- → commands:

```
echo the home directory of $USER is $HOME

ls ~ ~/AFNI datal ~/AFNI datal/afni/ideal r1.1D
```

- → script: an interpreted program (interpreted by another program)
  - e.g. consider the c00.all script: cat ~/AFNI data1/ht03/c00.all

### The Shell: command line processing

- → command interpreter (case and syntax sensitive)
- → examples: tcsh, csh, sh, bash, ksh, zsh, wish, tclsh, rsh, ssh
- → command: echo \$SHELL

### • The T-shell: /bin/tcsh

- → an enhanced C-shell (csh), which has C programming style syntax
- → command line processing, simplified outline:
  - evaluate special characters, such as:

```
>~!@#$:&()*?\"^[]|{}
```

- decide which program(s) to execute
  - full pathname, alias, shell command, search the \$PATH
- > execute appropriate program, giving it the parameter list
- > save the execution status in the \$status variable
  - command: Is \$HOME ~/suma demo '\$pickle'
- tcsh has automatic filename completion using the Tab key
  - > type "ls suma" and hit the *Tab* key, watch what happens, and hit *Enter*
  - > type "ls AF" and hit the Tab key, note what happens

### Special Characters

```
$: used to access a variable (e.g. $home)
& : used to put a command in the background (e.g. afni &)
* : wildcard, matching zero or more characters (e.g. Is AFNI d*)
: wildcard, matching exactly one character (e.g. Is AFNI data?)
\ : command line continuation (must be the last character on the line)
: the shell will not evaluate special characters contained within these quotes
   (e.g. echo '$HOME' gives $HOME, not /home/user)
": the shell will evaluate $variables and `commands` contained within these
   (e.g. echo "[*] my home dir is $HOME")
   (e.g. echo "the numbers are 'count -digits 2 7 12'")
: execute the command contained within these quotes, and replace the quoted
  part with the output of the contained command
   (e.g. echo "the numbers are `count -digits 2 7 12`")
```

~ : the current user's home directory (e.g. /home/user)

### Command Types

→ consider the commands:

```
/bin/ls ~
ls ~
cd ~
wc ~/AFNI_data1/afni/ideal_r1.1D
```

→ the "which" command shows where the shell gets a command from:

which ls

which cd

which wc

- → the shell must decide what type of command it has:
  - full pathname for a program: execute that program
  - alias: apply any alias(es) then start over (decide on which program to run)
  - shell command: part of the /bin/tcsh program
  - check the \$PATH directories for the program

#### The PATH Variable

- → a list of directories to be searched for a given program to be run from
- → the \$path and \$PATH variables are identical, but are represented differently

#### Shell Variables

- → shell variables are variables that are stored in, and affect the shell
- → all variables are stored as strings (or as arrays of strings)
- → a variable is accessed via the '\$' character
- → the 'echo' command: echo the line after processing any special characters
  - command: echo my home dir, \$HOME, holds ~/\*
- → the 'set' command: set or assign values to one or more variables
  - without arguments: 'set' displays all variables, along with any values
  - 'set' takes a list of variables to set, possibly with values
  - consider the commands:

```
set food
echo $food
set food = pickle
echo $food
echo $pickle
set eat food = chocolate donut
set
set food = "eat chocolate donut"
echo $food
```

→ variables can be assigned the result of a numerical computation using the '@' command, however only integer arithmetic is allowed

```
commands: set value1 = 17@ value2 = $value1 * 2 + 6echo value2 = $value2
```

### Array Variables

```
→ array variables are set using ()

→ consider the commands:

set stuff = ( 11 12 13 seven 15 )

echo $stuff
echo $stuff[1]
echo $stuff[2-4]
echo $stuff[8]
set stuff = ( hi $stuff $food )
echo $stuff
echo $path
cat ~/.cshrc
```

#### Environment Variables

- → similar to shell variables, but their values will propagate to children shells
- → by convention, these variables are all upper-case (though it is not required)
- → similarly, shell variables are generally all lower-case
- → set environment variables using "setenv" (as opposed to the "set" command)
- → without any parameters, the "setenv" command will display all variables
- → the "setenv" command will only set or assign one variable at a time
- → the format for the command to set a value is (without any '=' sign):

#### setenv VARIABLE value

commands:

```
setenv MY_NAME Elvis
echo $MY_NAME
echo $path
echo $PATH
echo $HOME
setenv
```

### Wildcards

- → used for shell-attempted filename matching
- → special characters for wildcards:

```
*, ?, [, ], ^
```

- \* : matches any string of zero or more characters(special case: a lone \* will not match files starting with '.')
- ? : matches exactly one character
- [] : matches any single character within the square brackets
- [^] : matches any single character EXCEPT for those within the brackets
- → commands (run from the ~/AFNI\_data1/SPGR\_anat directory):

```
ls
ls *
ls -a
ls I.*
ls I.04?
ls I.0[123] *
ls I.0[^123] *
echo I.0[^123] *
```

### Shell Scripts

- → a text file, a sequence of shell commands
- → the '\' character can be used for line continuation (for readability)
  - for that purpose, it <u>must</u> be the last character on the line (including spaces)
- → executing shell scripts, 3 methods:

```
tcsh filename : execute filename as t-shell commands
./filename : execute filename according to the top "#!program"
```

- > if no such line, use the current shell
- the file must have execute permissions (see 'ls -1')

```
source filename : execute filename using current shell
```

- this method affects the current environment, so it should be used only when that is the intention (e.g. .cshrc)
- → consider ~/AFNI\_data1/ht03/c00.all
- → consider ~/AFNI data1/ht03/@stim analyze
- → use the command "nedit my.script" to create a script with a few commands echo hello there

```
ls -a
cd $HOME/AFNI_data1
ls -al
```

→ run the script using the command: tcsh my.script

## • Some Shell Commands (handled by the shell)

cd : change working directory

echo : echo command line to the terminal window

pwd : echo the present working directory

set : set variables or assign string values to variables

e : set a variable to the results of an integral computation

alias : display or create an alias

(e.g. alias hi 'echo hello there')

bg : put a process in the background (usually after ctrl-z)

fg : put a process in the foreground

exit : terminate the shell

setenv : set environment variables

source : execute a script within the current shell environment

special keystrokes (to use while a process is running)

ctrl-c : send an interrupt signal to the process

ctrl-z : send a suspend signal to the process

### More Shell Commands: basic flow control

```
→ commands: if, else, endif, while, end, foreach
    if ( $user == "elvis" ) then
        echo 'the king lives!'
    endif
    set value = 5
    set fact = 1
    while ( $value > 0 )
      @ fact = $fact * $value
      @ value -= 1
    end
    echo 5 factorial = $fact
    foreach value ( 1 2 3 four eight 11 )
      echo the current value is $value
    end
    foreach file ( I.*3 )
      ls -1 $file
    end
```

### Pipes and Redirection

```
: redirect program output (stdout) to a file
>
      e.g. waver -help > waver.help
          waver -pickle > waver.help
   : redirect all output (both stdout and stderr) to a file
      e.g. waver -pickle >& waver.pickle
      e.g. tcsh my.script >& script.output
    : append program output to a file
>>
    : pipe standard output to the input of another program
      e.g. 3dDeconvolve -help | less
   : include stderr in the pipe
&
      e.g. tcsh my.big.script & tee script.output
             run the script
             send all output to the tee program
             the tee program duplicates the input, sending the output to both
             the terminal and the given file (script.output)
             you can see the output, but it is also stored for future analysis
```

#### Some OS Commands

```
: list the contents of a directory
  ls
          : concatenate files to the terminal (print them to the screen)
* cat
          : a file perusal program - view files one page at a time
          : a better file perusal program (type less, get more)
* less
          : on-line manuals for many OS commands (and library functions)
  man
            - this uses a "less" interface to display the information
            - e.g. consider man on : ls, less, man, tcsh, afni
          : a new program to replace the "man" program
  info
* head
          : display the top lines of a file (default = 10)
           -e.g. 3dDeconvolve -help | head -25
* tail
          : display the bottom lines of a file (default = 10)
           -e.q. tail ideal r1.1D
          : word count - count characters, words and lines (of a file)
* WC
          : BE CAREFUL - remove files and/or directories (no recovery)
  rm
           -e.g. rm junk.file
           - e.g. rm -r bad.directory
```

<sup>\*</sup> denotes a 'filter' program, which can take input from a file or from stdin

- \* grep : print lines from a file that match the given pattern
  - e.g. grep path ~/.cshrc
  - e.g. ls ~/abin | grep -i vol
  - e.g. from the output of "3dVol2Surf -help" show lines which contain 'surf', but not 'surface', then remove duplicates

```
3dVol2Surf -help | grep surf | grep -v surface | sort | uniq
```

## Some Special Files (in the home directory)

- .cshrc : c-shell startup file ("csh run commands")
  - > set aliases
  - adjust the path
  - > set shell and environment variables
- .afnirc : AFNI startup file
- .sumarc : suma startup file
- .login : commands run at the start of a login shell (e.g. a terminal window)
- .logout : commands run before exiting a login shell
- .tcshrc : t-shell startup file (if it does not exist, the .cshrc file will be used)
