Instant Analyses in AFNI and SUMA: Clusters and Correlations

Data for this presentation:
AFNI_data5/ directory

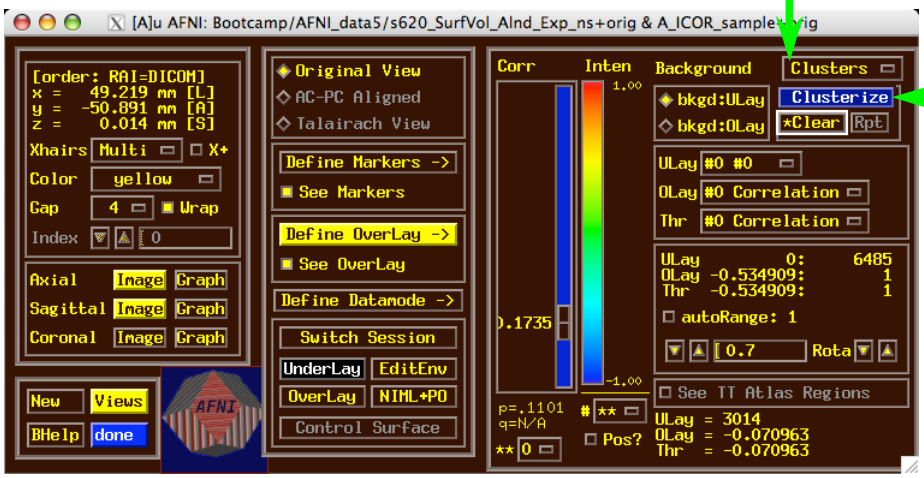
All data herein from Alex Martin, *et al.* [NIMH IRP]

AFNI "Insta" Functions

- 3 new capabilities added to the interactive AFNI
- Each one: compute new dataset volumes **insta**ntly to replace the Overlay volume for image viewing
- **Clusters** = interactive clustering
  - ★ remove clusters below a user-chosen size
  - ★ display a table of clusters
- **InstaCorr** = interactive exploration of inter-voxel time series correlation
  - ★ choose a seed voxel and see correlation map
  - ★ SUMA version also exists
- **InstaCalc** = interactive version of **3dcalc**
  - ★ e.g., display ratio of 2 datasets

AFNI! Clusters: Setup

- Open **Define Overlay**, choose **Clusters** from menu in top right corner



- Then press **Clusterize** to get the clusters control menu

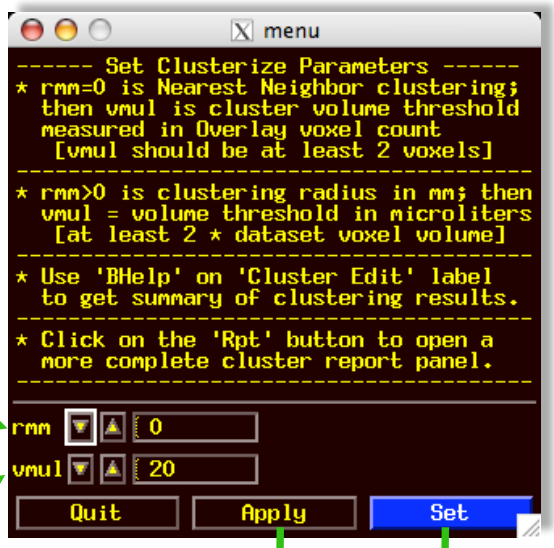
Clusters Control Menu

Operates on user's chosen Overlay dataset at the user's threshold;
Next slide example:
AFNI_ICOR_sample

Default: NN clustering

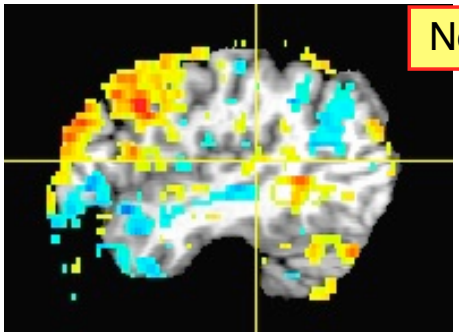
Default: 20 voxel minimum cluster size

Clustering is done in 3D

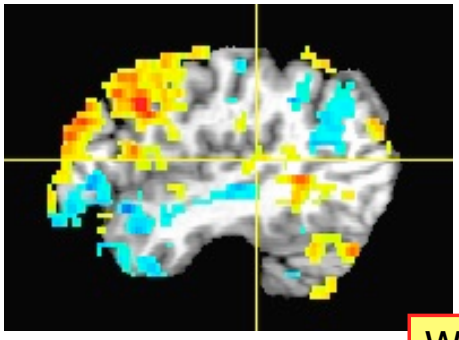


Press one of these buttons to create clusterized volume for display as new Overlay

Clusters Results



No clustering

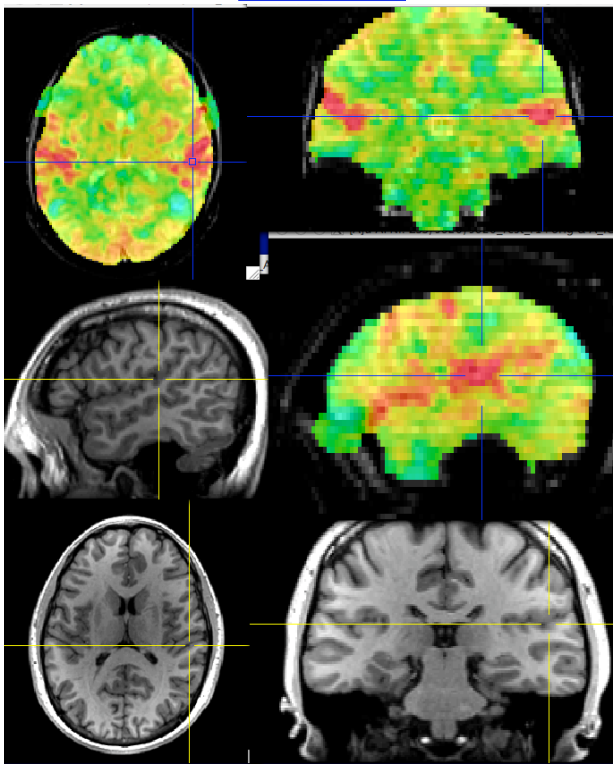


With clustering

Cluster report window

Jump: crosshairs move
Flash: colors on & off

AFNI InstaCorr



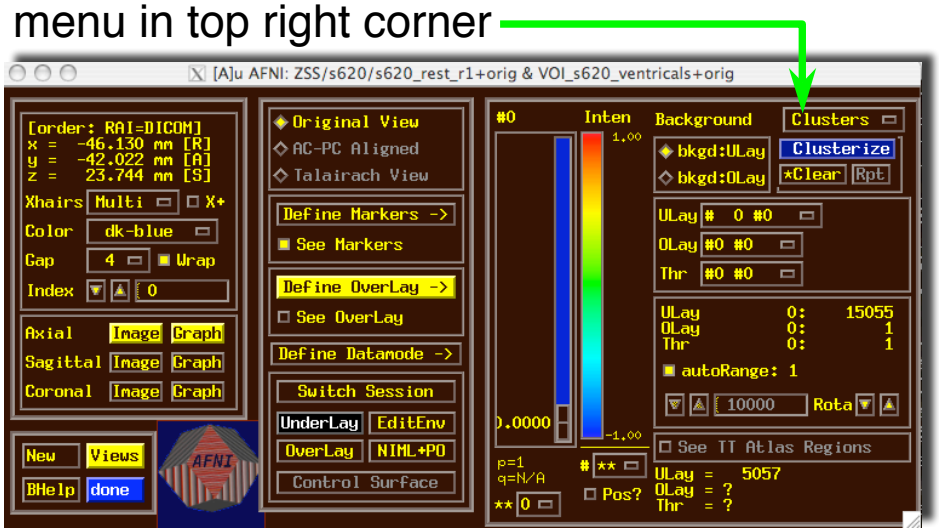
- On-the-fly **insta**ntaneous **corr**elation map of resting state data with interactively selected seed voxel
- **Setup phase**: prepares data for correlations (several-to-10+ seconds)
- **Correlation phase**: you select seed voxel, correlation map appears by ***magic***

InstaCorr: Outline of 2 Phases

- **Setup phase**:
  - ★ Masking: user-selected *or* Automask
  - ★ Bandpass and other filtering of voxel time series
  - ★ Blurring inside mask = the slowest part
- **Correlation phase**:
  - ★ Correlate selected seed voxel time series with all other prepared voxel time series
  - ★ Make new dataset, if needed, to store results
  - ★ Save seed time series for graphing
  - ★ Redisplay color overlay
  - ★ Optional: compute FDR curve for correlations
    - o Calculation is slow, so FDR is not turned on by default

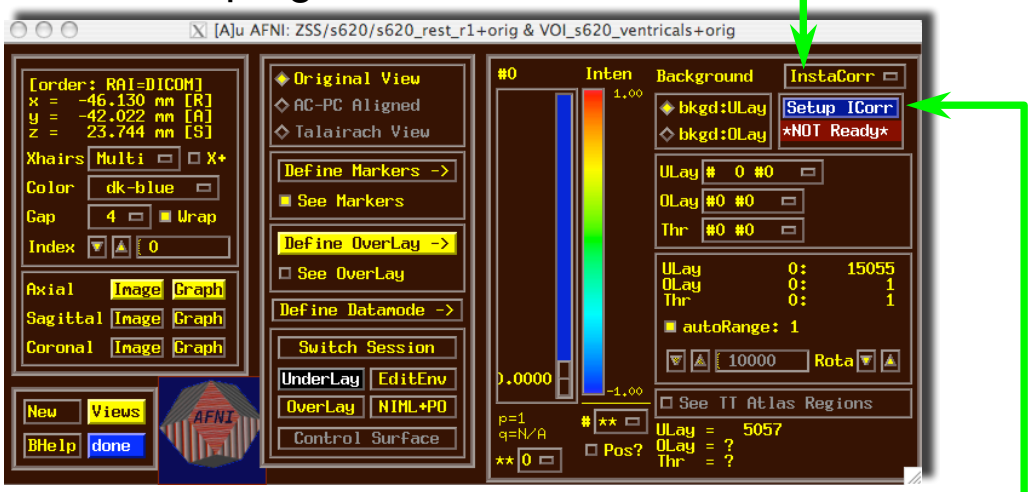
InstaCorr: Setup

- Open `Define Overlay`, choose `InstaCorr` from menu in top right corner



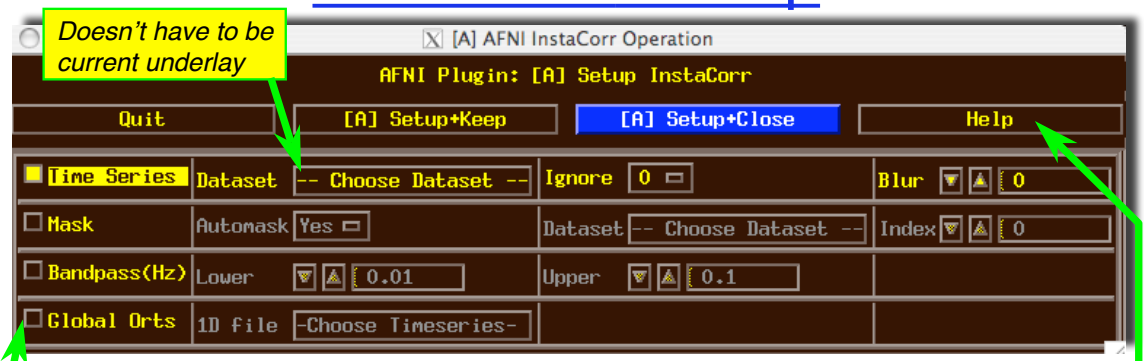
InstaCorr: Setup

- Open **Define Overlay**, choose **InstaCorr** from menu in top right corner



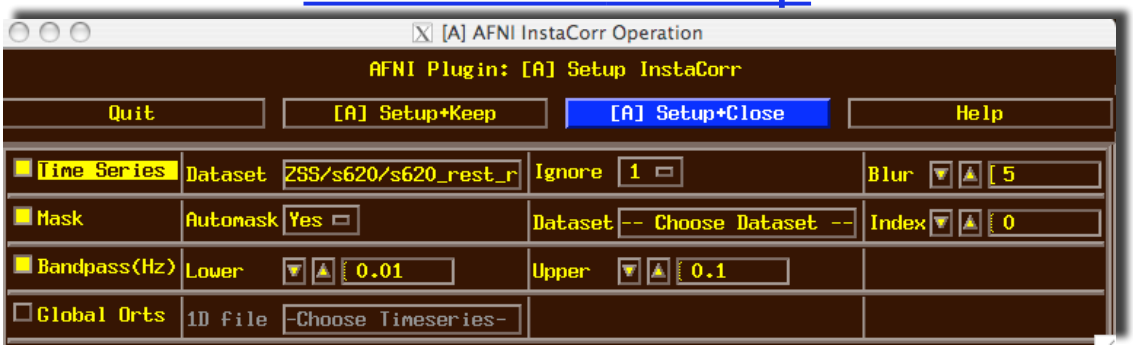
- Then press **Setup ICorr** button to get control panel

InstaCorr: Setup



- Mostly self-explanatory (I hope) — *cf.* **Help**
- **Global Orts** = extra time series to be projected out of dataset before correlation
  - ★ All columns in selected 1D file
  - ★ *e.g.*, movement parameters
  - ★ The first **Ignore** rows (time points) will be skipped
- When ready, press one of the **Setup** buttons

InstaCorr: Setup



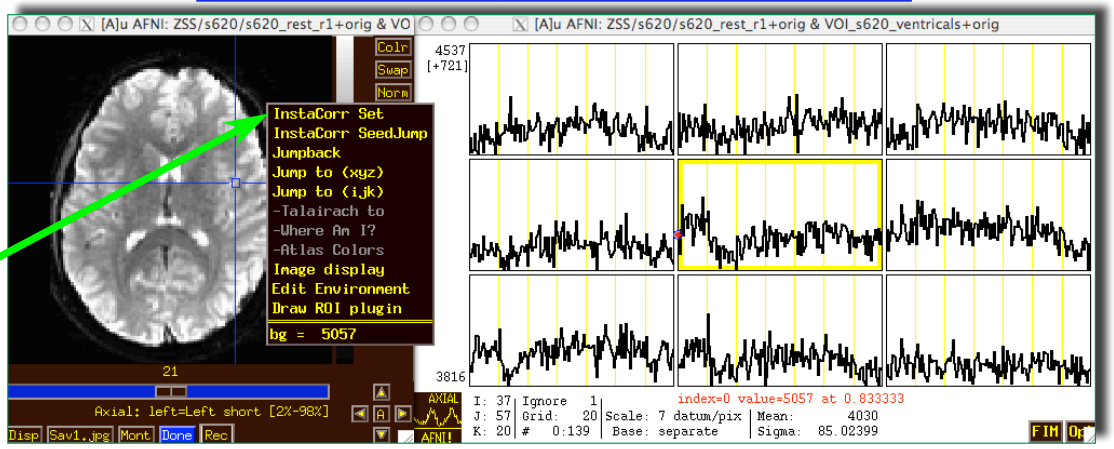
- Text output to shell window details the setup procedures:

```
++ InstaCorr preparations:
 + Automask from
  '/Users/rwcox/data/Resting/ZSS/s620/s620_rest_r1+orig.BRIK' has
  197234 voxels
 + Extracting dataset time series
 + Filtering 197234 dataset time series
 + bandpass: ntime=139 nFFT=160 dt=3.5 dFreq=0.00178571
  Nyquist=0.142857 passband indexes=6..56
 + Spatially blurring 139 dataset volumes
 + Normalizing dataset time series
++ InstaCorr setup: 197234 voxels ready for work: 15.43 sec
```

Dataset being analyzed

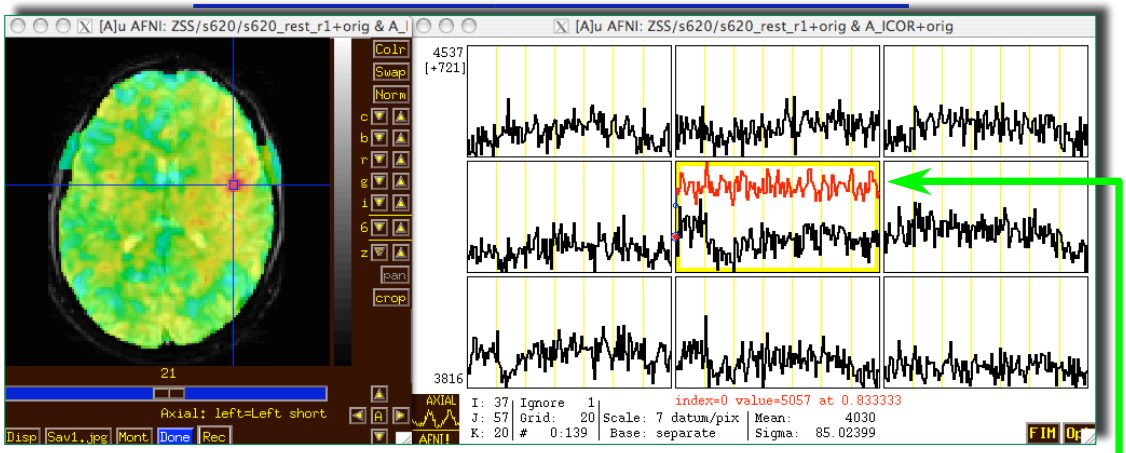
Most of the CPU time: Uses `BlurInMask`

InstaCorr: The Fun Part



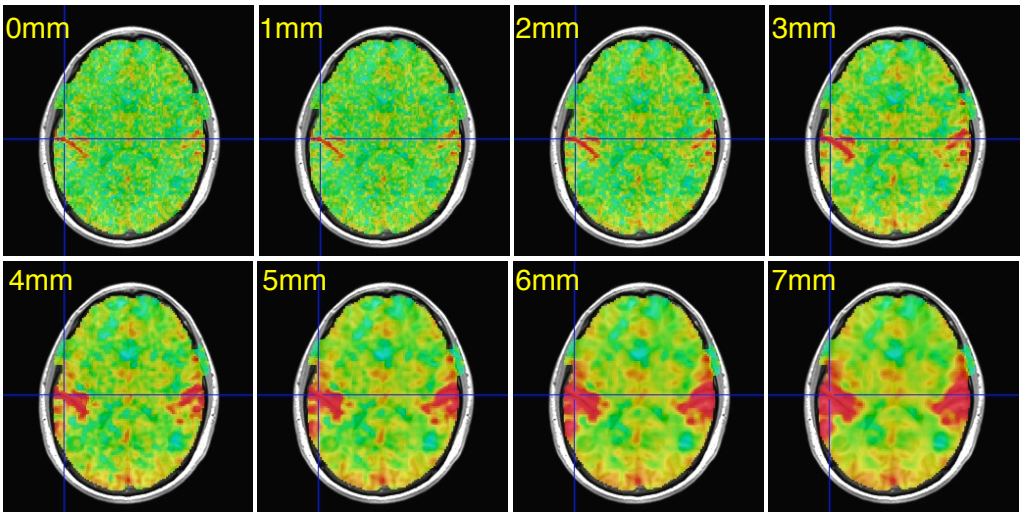
- In image viewer, set crosshairs to desired seed voxel
- **Right-click** popup menu → `InstaCorr Set`
  - ⋆ Creates new dataset `A_ICOR` for Overlay
- ***Shortcut***: **Shift+Ctrl+Left-click** sets new crosshair location, then does `InstaCorr Set`
- `InstaCorr SeedJump` jumps focus to current seed

InstaCorr: The Fun Part



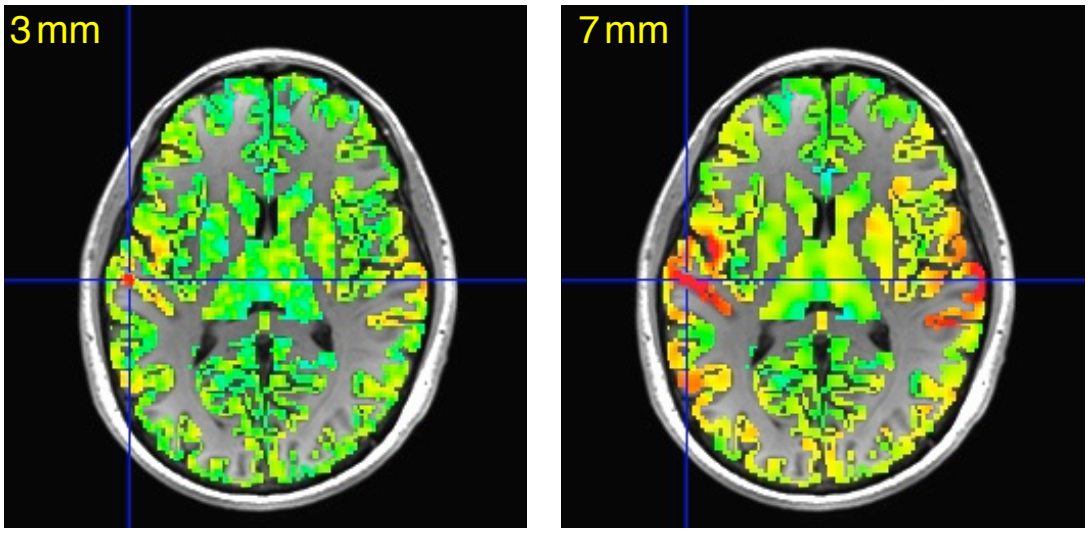
- In graph window:
  - ★ Set **Ignore** with **FIM→Ignore** menu (or **I** key)
  - ★ Set seed overlay with **FIM→Pick Ideal** menu
- When you change seed voxel, saved overlay time series will change (but you have to refresh graph to see it)

InstaCorr: Effects of Blurring



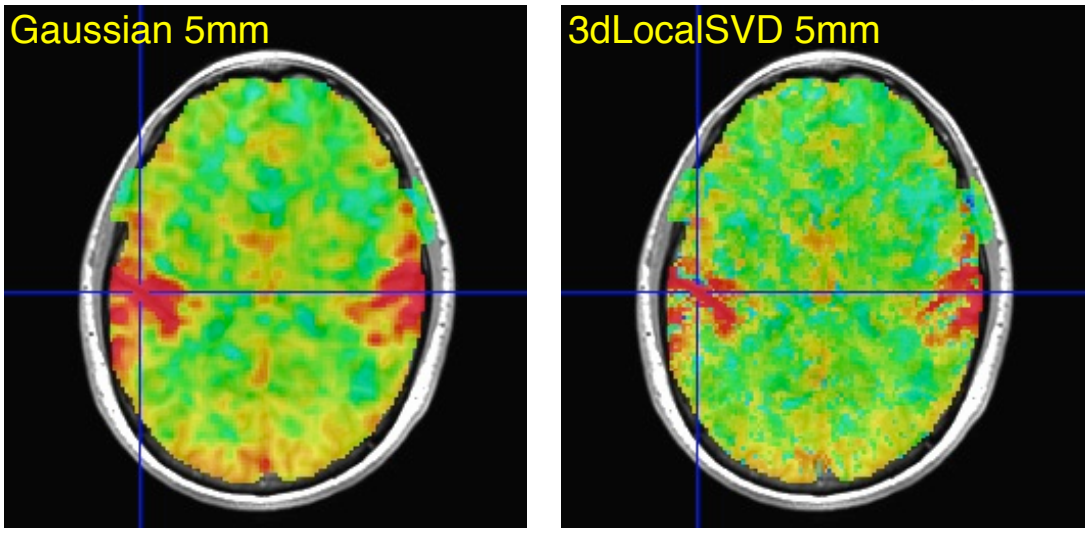
- Is this a pure vascular/cardiac effect being progressively smeared? Or real neural correlations seen via BOLD? Or some of both? *Venograms*?
  - ★ Dataset was RETROICOR-ized; mask is whole brain

InstaCorr: Effects of Blurring



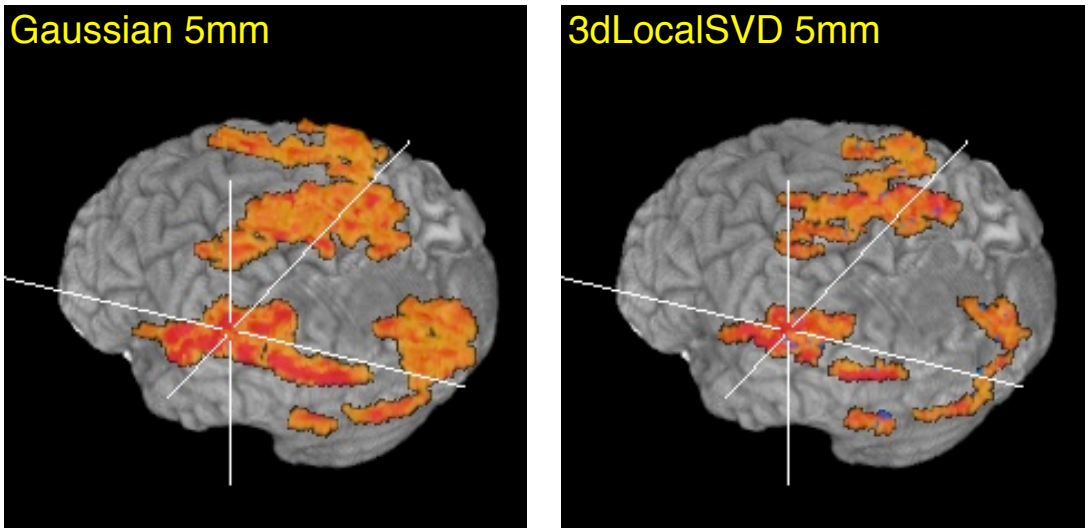
- Similar calculations, but with FreeSurfer-generated gray matter mask instead of Automask from EPI data
  - ★ Blurring is done only inside the mask (`3dBlurInMask`)
    - Using a discrete PDE-based iterative approach

InstaCorr: SVD-based "Blurring"



- Similar calculations, with Automask from EPI data, using `3dLocalSVD` over 5 mm radius sphere (67 voxels)
  - ★ Project each vector onto 2-dim principal subspace
  - ★ Far too slow to calculate interactively (at this time)

InstaCorr: SVD-based "Blurring"



- Volume rendering of InstaCorr maps (threshold at r=0.5)
  - ★ Renderer updates automatically if `DynaDraw` is on
- SVD smoothing has cleaner spatial structure?
  - ★ Or has it lost some information? *I don't know.*

InstaCorr: Options and Plans

- Underlay doesn't have to be EPI data; could be anat
  - ★ Can use InstaCorr in multiple AFNI controllers
- FDR: `setenv AFNI_INSTACORR_FDR YES`
  - ★ Will slow things down by a significant factor
- Saving `A_ICOR` dataset: overwrites previous copies
- Future Possibilities:
  - ★ Select ROI-based Orts to be detrended?
    - o Based on ROIs from FreeSurfer or atlases?
  - ★ Or multiple seeds (partial + multiple correlations)?
  - ★ Interactive local SVD "smoothing"? (needs speedup)
  - ★ Group analysis InstaCorr (in standardized space)
    - o Not quite "Insta" any more; ≈0.1×#Subjects sec per seed
    - o External script to do subject setups?
  - ★ Use time series subsets? (*e.g.*, for block design data)

Group InstaCorr

- If you have a robust enough system (multiple CPUs, several gigabytes of RAM), you can do interactive group analysis of resting state seed-based correlation
- **Setup Phase**:
  - ★ Unlike individual InstaCorr, the setup is done outside the AFNI GUI with command line programs
  - ★ Step 1: transform all time series datasets to standard space = **@auto_tlrc** and **adwarp**
  - ★ Step 2: filter and blur all time series dataset = **3dBandpass**
  - ★ Step 3: collect groups of time series datasets into one big file = **3dSetupGroupInCorr**
- **Interactive Phase**: point-and-click to set seed voxel

31 Dec 2009

GroupInCorr: Setup #1

- Assume datasets are named as follows:
  - ★ T1-weighted anatomical = **sXXX_anat+orig**
  - ★ Resting state EPI = **sXXX_rest+orig**

```
foreach fred ( s*_anat+orig.HEAD )
 set sub = `basename $fred _anat+orig.HEAD`
# transform anat to MNI space
 @auto_tlrc -base ~/abin/MNI_avg152T1+tlrc.HEAD -input $fred
# transform EPI to MNI as well (assume anat & EPI are aligned)
 adwarp -apar ${sub}_anat+tlrc.HEAD -dpar \
        ${sub}_rest+orig.HEAD -resam Cu -dxyz 2.0
# make individual subject mask
 3dAutomask -dilate 1 -prefix ${sub}_amask \
            ${sub}_rest+tlrc.HEAD
end

# Combine individual EPI masks into group mask
3dMean -sum -nscale -prefix ALL_amask *_amask+tlrc.HEAD
```

GroupInCorr: Setup #2

- Bandpass and blur each dataset inside mask
  - ★ skip first 4 time points, and remove global signal
  - ★ of course, you can choose your own options for filtering
    - o Can have **1** voxel-dependent time series to detrend, via **-dsort**

```
foreach fred ( s*_rest+tlrc.HEAD )
 set sub = `basename $fred _rest+tlrc.HEAD`
# create global signal file here
 3dmaskave -mask ALL_amask+tlrc -quiet \
           $fred'[4..$]' > ${sub}_GS.1D
# 3dBandpass does blurring, filtering, and detrending
 3dBandpass -mask ALL_amask+tlrc -blur 6.0    \
            -band 0.01 0.10 -prefix ${sub}_BP \
            -input $fred -ort ${sub}_GS.1D
end
```

GroupInCorr: Setup #3

- **3dSetupGroupInCorr** reads all filtered & blurred resting state EPI datasets, masks & normalizes them, and writes them to one big file for **3dGroupInCorr**
  - ★ Sample below: 2 groups of subjects

```
set AAA = ( s601 s604 … s644 s646 )
set BBB = ( s611 s612 … s652 s654 )
set ggg = ( )
foreach fred ( $AAA )
 set ggg = ( $ggg ${fred}_BP+tlrc.HEAD )
end
3dSetupGroupInCorr -mask ALL_amask+tlrc -prefix AAA $ggg
set ggg = ( )
foreach fred ( $BBB )
 set ggg = ( $ggg ${fred}_BP+tlrc.HEAD )
end
3dSetupGroupInCorr -mask ALL_amask+tlrc -prefix BBB $ggg
```

GroupInCorr: Interactive Phase

- Start server program (2 sample *t*-test here):

```
3dGroupInCorr -setA AAA.grpincorr.niml \
              -setB BBB.grpincorr.niml -verb
```

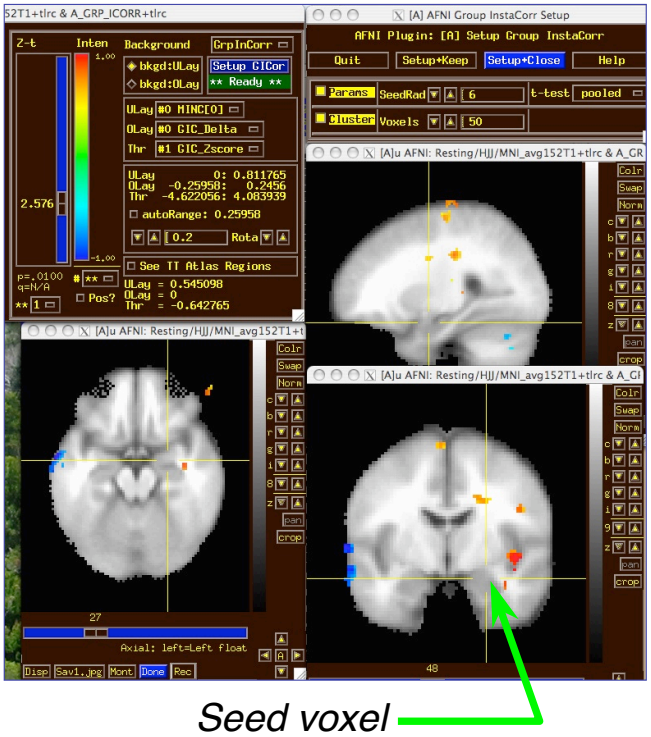
  - Startup takes a little while, as all data must be read into RAM (in this example, 3.2 Gbytes)
  - After data is read, connect to AFNI using a NIML socket
  - Server will use multiple CPUs if compiled with OpenMP (currently on Mac OS X 10.5 and 10.6)

- In a separate text window, start AFNI:

```
afni -niml
```

  - Then open the **`Define Datamode`** control panel

GrpInCorr: Interactive Results



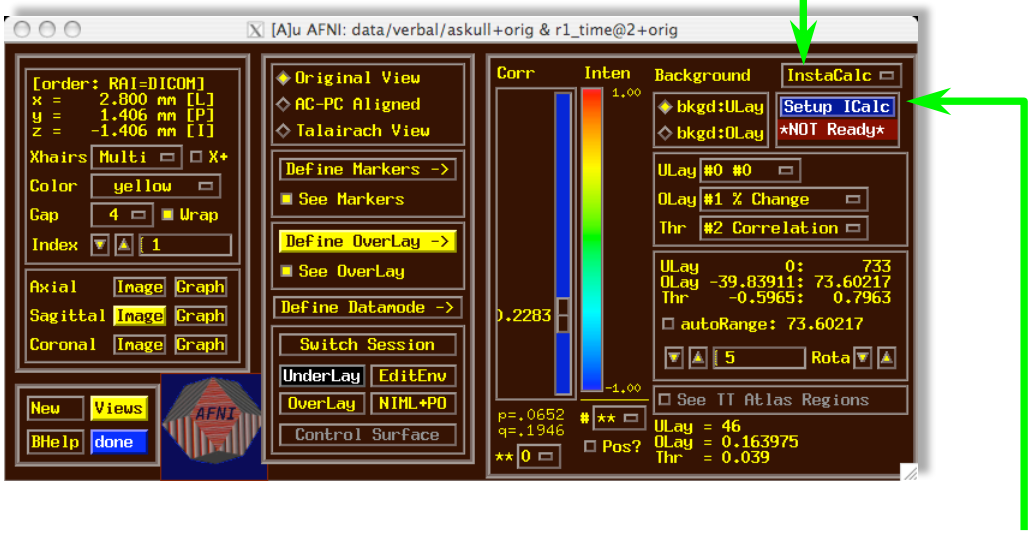
- Use same buttons as individual subject `InstaCorr` to set seed
- Use **`Setup GICorr`** panel to set the few options available interactively
  - ★ **`SeedRad`** = extra smoothing for seed voxel time series
  - ★ **`Cluster`** = min number of voxels to keep above thresh

GrpInCorr: Caveats

- You can do a 1-sample t-test (`-setA` only) or a 2-sample t-test (`-setA` and `-setB`)
  - ★ But not both at the same time
- Sometimes AFNI drops the shared memory connection to `3dGroupInCorr`
  - ★ Due to unknown bugs somewhere
  - ★ If this gets bad, use the `-NOshm` option to `3dGroupInCorr` to force it to use TCP/IP = slower data transfer but more reliable
- Brand new software = rough around the edges, and need *constructive* feedback

InstaCalc: Dataset Calculator

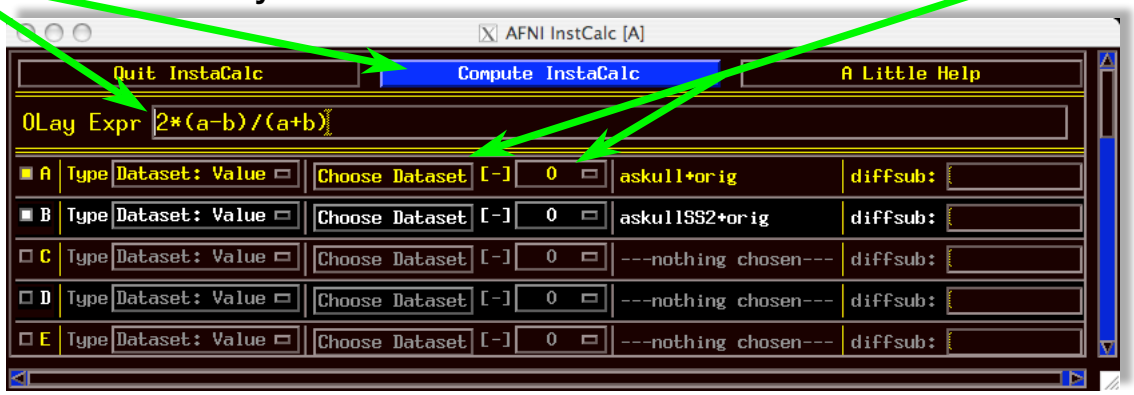
- Open `Define Overlay`, choose `InstaCalc` from menu in top right corner



- Then press `Setup ICalc` button to get control panel

InstaCalc: Setup

- Select datasets with `Choose Dataset` buttons
  - ★ and sub-bricks with the `[-]` controls
- Enter symbolic expression
- Press `Compute InstaCalc`
- Creates new 1-brick dataset **`A_ICALC`** for Overlay
  - ★ voxel-by-voxel calculations

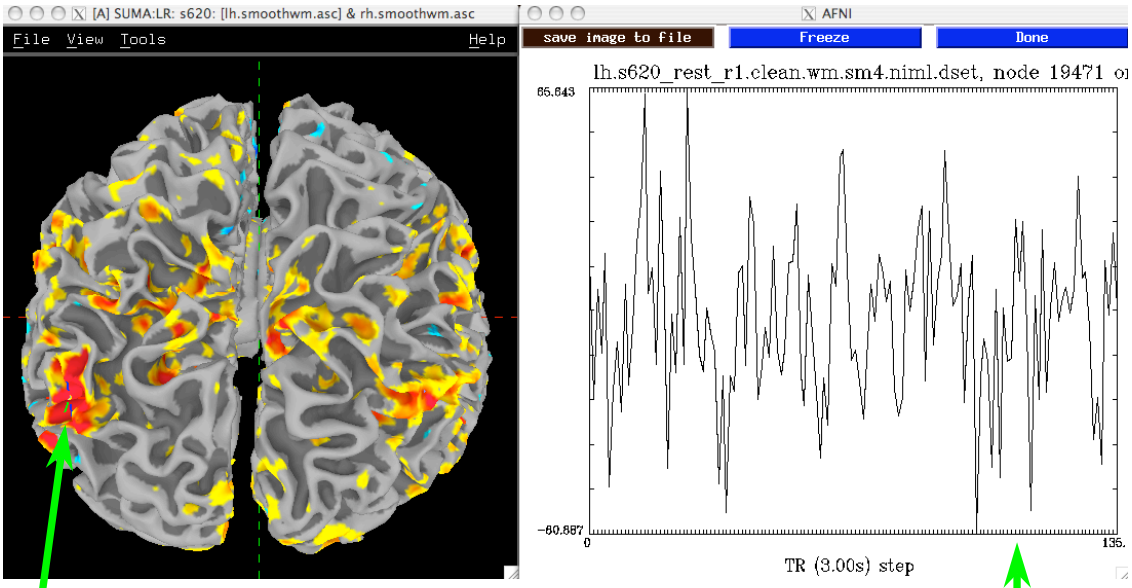


SUMA! InstaCorr

- Similar in concept to AFNI **InstaCorr** but requires some external pre-processing of time series datasets
  - ★ Removal of baseline, projection to surface, blurring
- In the **AFNI_data5/** directory, run the script

  tcsh ./@run_REST_demo
  - ★ starts SUMA with 2 hemispheres
  - ★ loads pre-processed datasets into SUMA
  - ★ sets up SUMA's **InstaCorr**
- After all the setup is ready, right-clicking on the surface will do the **InstaCorr** calculations

SUMA! InstaCorr: Sample



Seed voxel and Seed voxel time series graph
