Hands-On Session: Regression Analysis

File: afni05_regression.pdf

Gang Chen

SSCC/NIMH/NIH/HHS

Overview

• What we have learned so far

 ➢ Use data viewer 'afni' interactively

 ➢ Model HRF with a shape-prefixed basis function (*e.g.*, Gamma variate)

 ❑ Assume the brain responds with the **same shape**

 ○ Across subjects, any activated regions, stimulus conditions/tasks, trials

 ❑ Differ in magnitude: β (and its significance) is what we focus on

• What we will do in this hands-on session

 ➢ Data pre-processing overview for time series regression analysis

 ➢ Basic concepts

 ❑ Regressors, design matrix, and confounding effects

 ❑ Statistical significance testing in regression analysis

 ➢ Navigation with GUI '**afni**'

 ❑ Spot check for the original data

 ❑ Statistic thresholding with data viewer '**afni**' (two-sided vs. one-tailed with t)

 ❑ Model performance (visual check of curve fitting and test via full F or R^2)

FMRI Regression Analysis

- Voxel-wise regression model: $y = X\beta + \varepsilon$
  - y: signal (time series) at a voxel – different across voxels
  - X: explanatory (independent) variables (regressors) – same across voxels
  - β: regression coefficients (response strength) – different across voxels
  - ε: residuals (anything we can't account for) – different across voxels
- Regressors in design matrix $X = [x_1, x_2, \ldots, x_k]$
  - Regressors of interest: hemodynamic responses (HDR)
  - Regressors of no interest: drift effect (polynomials), head motion, *etc.*
- Association between stimulus and BOLD signal: HDR/HRF
  - Pre-fixed shape regardless of subjects, brain regions, stimuli: regression
  - No assumption about the HDR shape: deconvolution + regression
  - Middle ground: regression
- Residuals
  - White noise: OLS – 3dDeconvolve
 - Serially correlated: ARMA(1,1)+REML – 3dREMLfit

A Case Study

- Speech Perception Task: Subjects were presented with audiovisual speech presented in a predominantly auditory or predominantly visual modality.

- A digital video system was used to capture auditory and visual speech from a female speaker.

- 2 types of stimulus conditions:

(1) **Auditory-Reliable**

Example: Subjects can clearly *hear* the word "cat," but the video of a woman mouthing the word is degraded.
(2) **Visual-Reliable**

Example: Subjects can clearly *see* the video of a woman mouthing the word "cat," but the audio of the word is degraded.

Experiment Design

◆ 3 runs in a scanning session

◆ Each run consisted of randomized 10 blocks:
  • 5 blocks contained Auditory-Reliable (*Arel*) stimuli, and
  • 5 blocks contained Visual-Reliable (*Vrel*) stimuli

◆ Each block contained 10 trials of *Arel* OR *Vrel* stimuli
  • Each block lasted for 20s (1s for stimulus presentation, followed by a 1s inter-stimulus interval)

◆ Each baseline block consisted of a 10s fixation point

Data Collected

- ◆ 2 anatomical datasets for each subject from a 3T

  - 175 sagittal slices

  - voxel dimensions = $1.0 \times 0.938 \times 0.938$ mm^3

- ◆ 3 time series (EPI) datasets for each subject

  - 33 axial slices $\times$ 152 volumes (TRs) per run

  - TR = 2s; voxel dimensions = $2.75 \times 2.75 \times 3.0$ mm^3

- ◆ Sample size, $\underline{n}$ = 10 (all right-handed subjects)

Data Quality Check

- To look at the data: type **cd AFNI_data6/afni**, then **afni &**

- **Switch Underlay** to dataset **epi_r1**

  ➢ Then **Axial Image** and **Graph**

  ➢ **FIM→Pick Ideal** ; then click **afni/epi_r1_ideal.1D** ; then **Set**

  ➢ Right-click in image, **Jump to (ijk)**, then **26 72 4**, then **Set**

- Data clearly has activity in sync with reference
  - o 20s blocks
- Data also has a big spike at 89s
  - o Head motion
- Spike at $t = 0$
- Some tricks with keyboard
  - o a: automatic scaling
  - o v: video mode
  - o m/M: voxel matrix sizing on Graph window

Preparing Data for Analysis

- Following preparatory steps are common (e.g., afni_proc.py):
  - Outliers: **3dToutcount** (or **3dTqual**), **3dDespike**
  - Temporal alignment or slice timing correction (sequential/interleaved): **3dTshift**
  - Image/volume registration (aka realignment, head motion correction): **3dvolreg**
  - Spatial normalization (standard space conversion): **adwarp, @auto_tlrc, anlign_epi_anat.py**
  - Blurring/smoothing: **3dmerge, 3dBlurToFWHM, 3dBlurInMask**
  - Masking: **3dAutomask**
  - Global mean scaling*: **3dROIstats** (or **3dmaskave**) and **3dcalc**
  - Temporal mean scaling: **3dTstat** and **3dcalc**

- Not all steps are necessary or desirable in any given case

Regression Analysis

- Regression model: $y = X\beta + \varepsilon$
- Run script by typing **tcsh rall_regress** (takes a few minutes)

```
3dDeconvolve -input rall_vr+orig -polort 1                            \
    -concat '1D: 0 150 300'                                           \
    -num_stimts 8                                                     \
    -stim_times 1 stim_AV1_vis.txt 'BLOCK(20,1)' -stim_label 1 Vrel   \
    -stim_times 2 stim_AV2_aud.txt 'BLOCK(20,1)' -stim_label 2 Arel   \
    -stim_file 3 motion.1D'[0]' -stim_base 3 -stim_label 3 roll       \
    -stim_file 4 motion.1D'[1]' -stim_base 4 -stim_label 4 pitch      \
    -stim_file 5 motion.1D'[2]' -stim_base 5 -stim_label 5 yaw        \
    -stim_file 6 motion.1D'[3]' -stim_base 6 -stim_label 6 dS         \
    -stim_file 7 motion.1D'[4]' -stim_base 7 -stim_label 7 dL         \
    -stim_file 8 motion.1D'[5]' -stim_base 8 -stim_label 8 dP         \
    -gltsym 'SYM: Vrel -Arel' -glt_label 1 V-A                        \
    -tout -x1D rall_X.xmat.1D -xjpeg rall_X.jpg                       \
    -fitts rall_fitts -bucket rall_func                              \
    -jobs 2
```

- 2 audiovisual stimulus classes were given using **-stim_times**
- **Important to include motion parameters as regressors**?
  - ➢May remove the confounding effects due to motion artifacts
  - ➢6 motion parameters as covariates via **-stim_file** + **-stim_base**
  - ➢**motion.1D** generated from **3dvolreg** with the **-1Dfile** option
  - ➢Test the significance of head motion parameters
    - ➢Add **-bout** or remove **-stim_base**
    - ➢Use **-gltsym 'SYM: roll \ pitch \yaw \dS \dL \dP'**
Modeling Serial Correlation in the Residuals

- Temporal correlation exists in the residuals of the time series regression model
- Within-subject variability (or statistical value) would get deflated (or inflated) if temporal correlation is not accounted for in the model
- Better correct for the temporal correlation if bringing both effect size and within-subject variability to group analysis
- ARMA(1, 1) assumed in **3dREMLfit**
- Script automatically generated by 3dDeconvolve (may use –x1D_stop)
  - ★ File **rall_func.REML_cmd** under **AFNI_data6/afni**
  - ★ Run it by typing **tcsh –x rall_func.REML_cmd**

```
3dREMLfit -matrix rall_X.xmat.1D -input rall_vr+orig \
  -tout -Rbuck rall_func_REML -Rvar rall_func_REMLvar \
  -Rfitts rall_fitts_REML -verb
```
Regressor Matrix X for This Script (via -xjpeg)

Baseline   Audiovisual stimuli   Head Motion

aiv rall_xmat.jpg

- 6 drift effect regressors
  - linear baseline
  - 3 runs times 2 params/run
- 2 regressors of interest

- 6 head motion regressors
  - 3 rotations and 3 shifts

Showing All Regressors (via -x1D)

All regressors: **1dplot -sepscl rall_X.mat.1D**

Plotting Regressors of Interest

Regressors of Interest: **1dplot rall_X.mat.1D'[6..7]'**

Options in 3dDeconvolve - 1

`-concat '1D: 0 150 300'`

- "File" that indicates where distinct imaging runs start inside the input file
  - ➤ Numbers are the time (TR) indexes inside the dataset file for start of runs
  - ➤ These time points are considered as discontinuities in the model
  - ➤ In this case, a text format .1D file put directly on the command line
    - o Could also be a filename, if you want to store that data externally

`-num_stimts 8`

- 2 audiovisual stimuli (+6 motion), thus 2 `-stim_times` below
- Times given in the `-stim_times` files are *local* to the start of each run

`-stim_times 1 stim_AV1_vis.txt 'BLOCK(20,1)' -stim_label 1 Vrel`

- Content of `stim_AV1_vis.txt`

  60 90 120 180 240

  120 150 180 210 270

  0 60 120 150 240

  ★ Each of 3 lines specifies start time in seconds for stimuli within the run

Options in 3dDeconvolve - 2

`-gltsym 'SYM: Vrel -Arel' -glt_label 1 V-A`

- **GLT**s: **G**eneral **L**inear **T**ests
- **3dDeconvolve** provides test statistics for each regressor separately, but to test combinations of the β weights in each voxel, we need **-gltsym** option
- Example above tests the difference between the β weights for the **Virual-reliable** and the **Audio-reliable** responses
  - ➢ **SYM:** means symbolic input is on command line
    - ○ Otherwise inputs will be read from a file
  - ➢ Symbolic names for each regressor taken from **-stim_label** options
  - ➢ Stimulus label can be preceded by **+** or **−** to indicate sign to use in combination of β weights
  - ➢ Leave space after each label!
- Goal is to test a linear combination of the β weights
  - Null hypothesis $\beta_{\mathbf{Vrel}} = \beta_{\mathbf{Arel}}$
  - e.g., does **Vrel** get different response from **Arel**?
- What do `'SYM: 0.5*Vrel +0.5*Arel'` and `'SYM: Vrel \ Arel'` test?

Options in 3dDeconvolve - 4

`-fout -tout` = output both *F*- and *t*-statistics for each
stimulus class (`-fout`) and stimulus coefficient (`-tout`) —
but not for the baseline coefficients (use `-bout` for baseline)

- The full model statistic is an *F*-statistic that shows how well all the regressors of interest explain the variability in the voxel time series data

  ➢ Compared to how well *just* the baseline model time series fit the data times (in this example, we have 12 baseline regressor columns in the matrix — 6 for the linear drift, plus 6 for motion regressors)

  ➢ $F = [SSE(r) - SSE(f)]/df(\text{n}) \div [SSE(f)/df(\text{d})]$

- The individual stimulus classes also will get individual *F*- (if `-fout` added) and/or *t*-statistics indicating the significance of their individual *incremental* contributions to the data time series fit

  ➢ If DF=1 (e.g., F for a single regressor), *t* is equivalent to *F*: $t(n) = F^2(1, n)$

Results of **rall_regress** Script

- Images showing results from third GLT contrast: **VrelvsArel**

- Menu showing labels from **3dDeconvolve**

- Play with these results yourself**!**

Compare 3dDeconvolve and 3dREMLfit

Group Analysis: will be carried out on β or `GLT` coef (+t-value) from single-subject analysis
