

Statistical & Scientific Computing Core

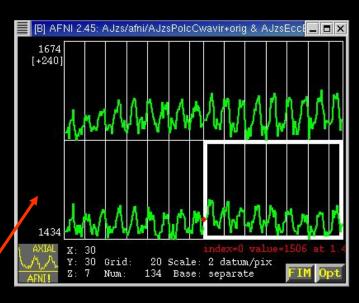

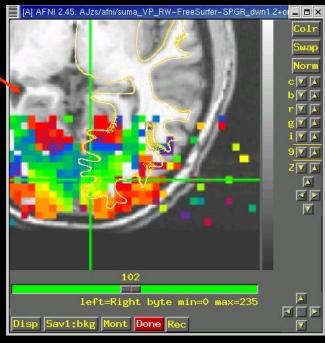

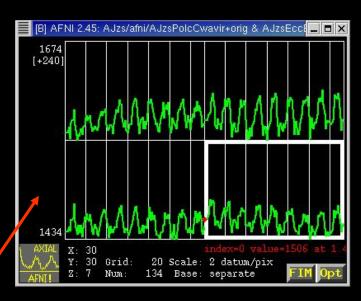

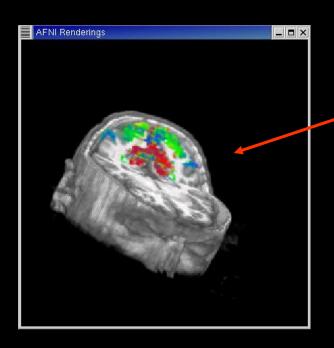

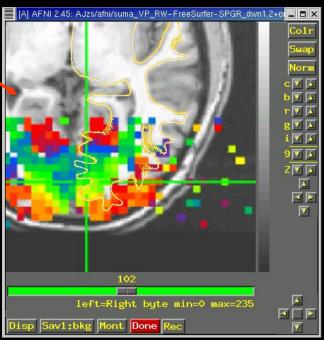

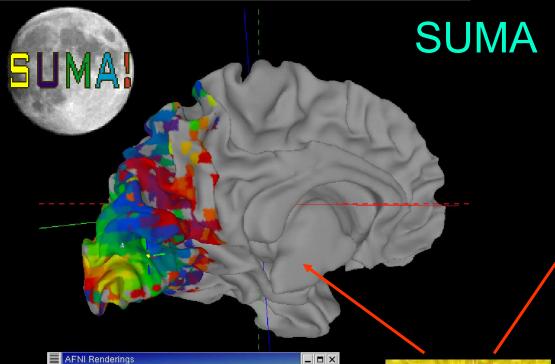

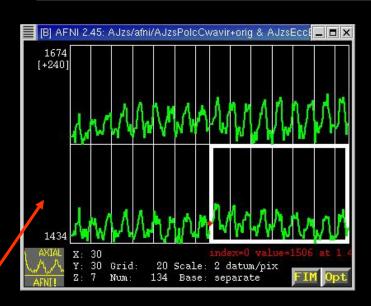

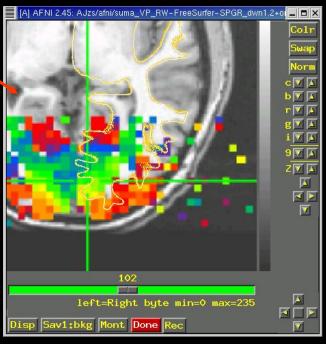

# SUrface MApping with AFNI

- Surface mapping & viewing program tightly linked to interactive AFNI — but SUMA is a separate program
- Complements AFNI's slice and volume rendering modes
  - AFNI works with data defined over volumes
  - SUMA works with data defined over surfaces
- Provides a framework for fast and user-customizable surface-based analysis
- Supports surface models created by:
   FreeSurfer http://surfer.nmr.mgh.harvard.edu
   SureFit/Caret http://stp.wustl.edu/resources/display.html
   BrainVoyager http://www.brainvoyager.com
- Allows representation of 2D and 3D objects in projection frame or surface coordinate space.

## The Process of Using SUMA

#### PreSUMA (setup phase):

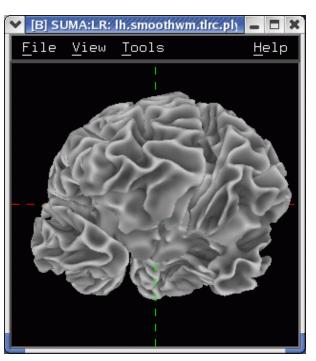

- Collect, align, and average high-quality, high-resolution anatomical data
  - Typically, having 1-3 MPRAGE datasets is good, depending on analysis
- Can correct image non-uniformity
  - Using AFNI's 3dUnifize or the N3 normalization tool [J.G. Sled et al. 98]
- Create and correct surfaces
  - Using FreeSurfer, SureFit, or BrainVoyager

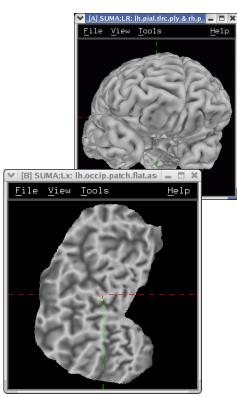

#### CircumSUMA

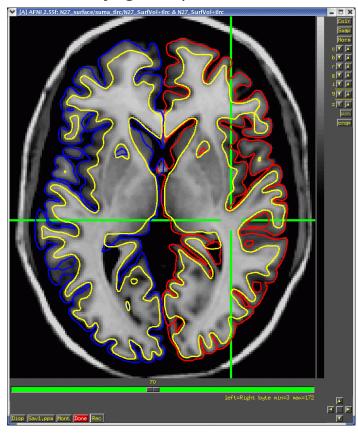

- Create standard-mesh version of surface models
- Align surface with experimental data
  - Using @SUMA\_AlignToExperiment
- Map experimental volumetric data to surface
  - Using AFNI and SUMA (interactively or with command line program)
- Time series analysis on datasets defined over surface domain
  - Smoothing, statistics, clustering, group analysis.

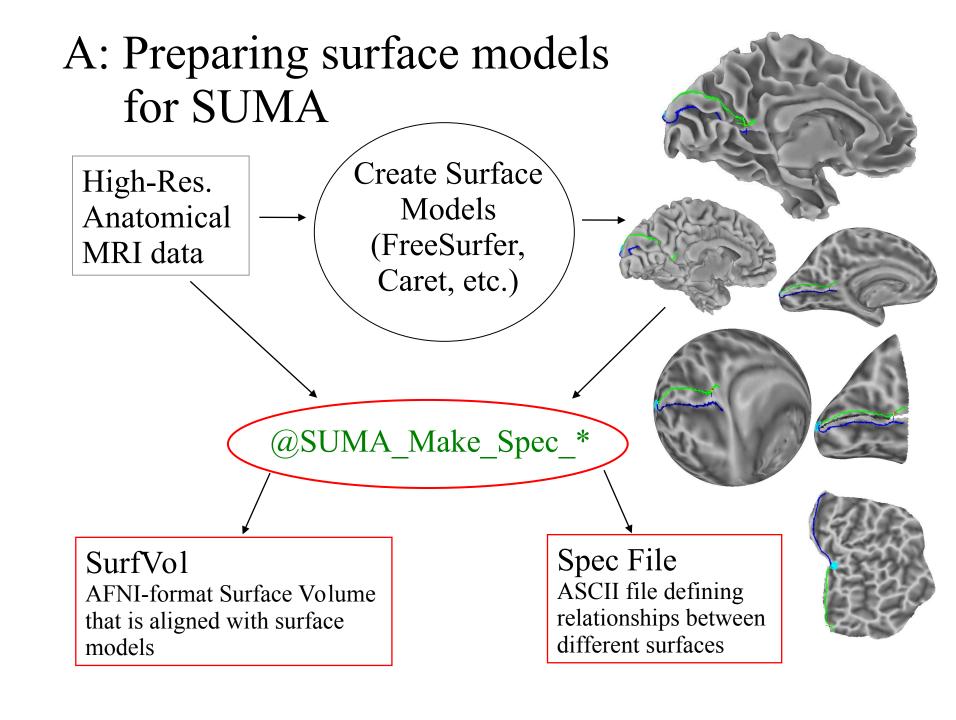

## The Simpler and Lesser Process

- For display (mostly) of Talairach or MNI data:
  - Use the Talairach (http://afni.nimh.nih.gov/pub/dist/tgz/suma\_TT\_N27.tgz) or MNI
     (http://afni.nimh.nih.gov/pub/dist/tgz/suma\_MNI\_N27.tgz) surfaces created from the
     N27 brain dataset using FreeSurfer.
  - Ready to use, no surface creation or alignment needed (but match to your subject's anatomy will not be very good)

# @SUMA\_Make\_Spec\_\* scripts

- These scripts prepare surfaces and volumes for use with SUMA:
  - @SUMA\_Make\_Spec\_FS for FreeSurfer surfaces
  - @SUMA\_Make\_Spec\_SF for SureFit surfaces
  - @SUMA\_Make\_Spec\_Caret for Caret surfaces
- Output of these scripts include:
  - Surface Volume: SurfVol
    - AFNI dataset created from anatomical MRI, used to create the surfaces
  - AFNI volumes of cortical and subcortical segmentations (FreeSurfer)
  - ASCII versions of all surfaces (FreeSurfer)
  - Surface specifications file: (\*.spec)
    - ASCII file defining relationships between family of surfaces.

## Viewing Surfaces with SUMA

After @SUMA\_Make\_Spec\_\* scripts are run, surface models should be in excellent alignment with SurfVol

- + Use SUMA to verify alignment
- + Scroll through the volume to make sure surfaces are accurate
  - Check especially for inferior temporal and occipital areas

#### Demo using FreeSurfer surfaces:

- + cd ~/AFNI data6/FT analysis/FT/SUMA
  - → This is where the output of @SUMA\_Make\_Spec\_FS
- + afni -niml &
  - → launches AFNI to allow the viewing of DemoSubj lh.spec
  - → the —niml option tells AFNI to listen to connections from SUMA
- + tcsh run.suma.00.both.141
  - → just one command to open surface viewer with desired dsets

## Check for proper alignment and defects

- With both SUMA and AFNI running
  - Press 't' in the suma window to 'talk' to AFNI
    - This sends anatomically correct surface(s) to AFNI
  - Switch AFNI Underlay to DemoSubj\_SurfVol+orig
    - Contours are the intersection of the surface with the slice.
      - $\Box$  You could also see boxes representing the nodes that are within  $\pm \frac{1}{2}$  slice from the center of the slice in view.
      - Colors and node box visibility can be changed to suit your desires from the Control Surface button in AFNI.
  - Navigate through the volume in AFNI
    - make sure you have an excellent alignment between volume and surface
    - make sure surface adequately represents areas of the brain that are difficult to segment
      - □ occipital cortex
      - inferior frontal and inferior temporal regions
    - ☐ Surface may *look* good in SUMA, but may not match anatomy in some places this is why you check surfaces in AFNI display

## Check for proper alignment and defects

- The Surface Volume and the surfaces must be in nearly perfect alignment.
  - If you have an improper alignment, it should be addressed here and now
    - This should not happen for FreeSurfer and SureFit surfaces created in the standard fashion.
  - Watch for error messages and warnings that come up in the shell as the surfaces are read in. These messages should be examined once per subject, since they do not change unless the surface's geometry or topology is changed.
  - Use Viewed without the volume underlay, it is extremely difficult to tell if surface models with no topological defects accurately represent the cortical surface.

- Rotating the surface:
  - Mouse button-1: keep it down while moving the mouse left to right.
    This rotates the surface about the screen's Y-axis (dotted green). Let go of button-1 (usually the left button).
  - Repeat with up and down motion for rotation about X-axis and motion in various directions for rotations mimicking those of a trackball interface.
  - □ Also try up/down/left/right ↑ ↓ ← → arrow keys.
    - Arrow keys rotate by increments specified by the Unix environment variable: SUMA\_ArrowRotAngle (degrees).
    - ☐ You can set SUMA environment variables in file ~/.sumarc

- Prying & Z rotating the hemispheres:
  - Mouse ctrl+button-1: Moving the mouse horizontally while button 1 is pressed and ctrl is down will pry hemispheres apart for better visualization. The prying behavior is different for spherical and flattened surfaces. Better try it than read about it.
    - Ctrl+button 1 doubleclick: Undo prying.
  - Mouse shift+button-1: Rotate surfaces about screen's Z-axis.
    This option is useful for positioning flat surfaces when displayed one at at time. In most other circumstances it leads to confusion.
    - Shift+button 1 doubleclick: Undo Z rotation

- Translating the surface:
  - Mouse button-2: keep it down while moving the mouse to translate surface along screen X and Y axes or any combinations of the two.
  - Also try Shift+arrow keys.
- Zooming in/out:
  - Both buttons 1&2 or Shift+button 2: while pressing buttons, move mouse down or up to zoom in and out, respectively.
  - Also try keyboard buttons 'Z' and 'z' for zooming in and out, respectively.

- Picking a Node or Facet:
  - Mouse button 3: press over a location on a surface to pick the closest facet and node to the location of the pointer.
    - The closest node is highlighted with a blue sphere
    - The closest facet is highlighted with a gray triangle
  - Note the information written to the shell regarding the properties of the picked Node and Facet.
  - When connected to AFNI (after having pressed 't'), watch the AFNI crosshair jump to the corresponding location in the volume.
  - Conversely, position the crosshair in AFNI (left click) at a position close to the surface and watch the crosshair relocate in SUMA.
- You can swap button 1 & 3's functions using the environment variable: SUMA\_SwapButtons\_1\_3

- Cardinal views (along coordinate directions):
  - ctrl + Left/Right: Views along LR axis
  - ctrl + Up/Down: Views along SI axis
  - ctrl + shift + Up/down: Views along AP axis
- Resetting the view point:
  - Press Home (fn+left arrow macs) to get back to the original vantage point.
- Using momentum feature:
  - Press 'm' to toggle momentum on. Click the left mouse button and release the button as you are dragging the mouse.
- Lots more:
  - Function keys modify various aspects of the display
    - Those may be usurped by OS X, see Keyboard setup
  - ctrl+h opens a help window for all interactive options.

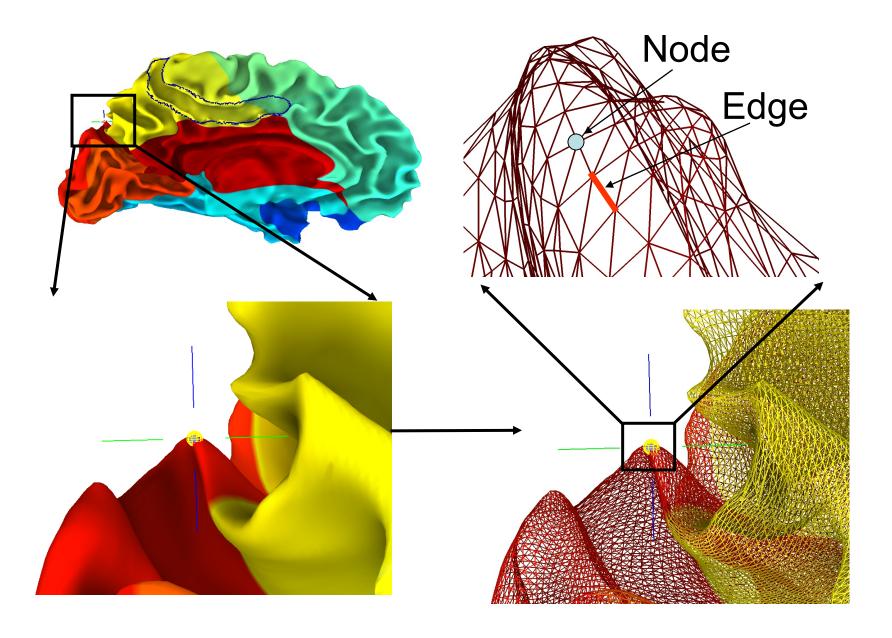

## Recording your beautiful SUMA images

- Using 'r' in SUMA to record the current scene (a single image).
- Using 'r' on the colorbar creates an image of the colorbar.
- Using 'R' to record continuously the rendered scene, as you change it.
- Images are captured by an AFNI-esque image viewer.
  - Identical consecutive images are rejected
  - Images caused by window expose events are ignored
  - Images can be saved in all ways allowed by AFNI, including MPEG and animated GIF movies
  - If you let the recorder run continuously with very large images, you might quickly run out of memory on your computer!
- Using 'ctrl+r' in SUMA to record current image directly to disk (see 'ctrl+h' for details)
- You can save/load viewer setting used to create a figure
  - □ Use File → Save View and File → Load View

### world ↔ AFNI ↔ SUMA ↔ world

- AFNI and SUMA are independent programs and communicate using NIML formatted data elements (a subset of XML)
  - Use Via shared memory or TCP/IP network sockets
  - Both AFNI and SUMA can also communicate with other programs
- NIML: NeuroImaging Markup Language (developed by RW Cox)
  - NIML is the main format for SUMA's data storage
- NIML API library for packing/unpacking data is available
- Protocol allows independent program to communicate with AFNI
- Advantages include:
  - Programs execute on separate machines
  - ☐ Fast development (programming with NIML is pretty easy)
  - ☐ Screen real-estate (more displays)
- Blemishes include:
  - Only one AFNI can be listening for connections
  - Only one SUMA can connect to AFNI

## What's a surface made of?

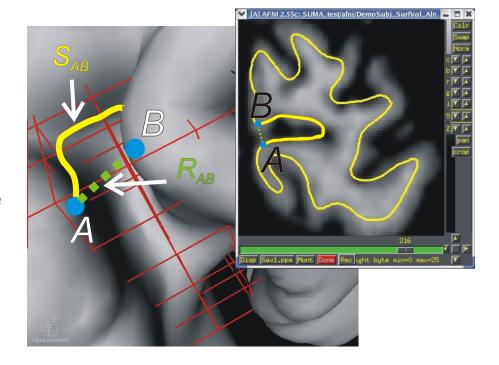

## Relationships between surface models

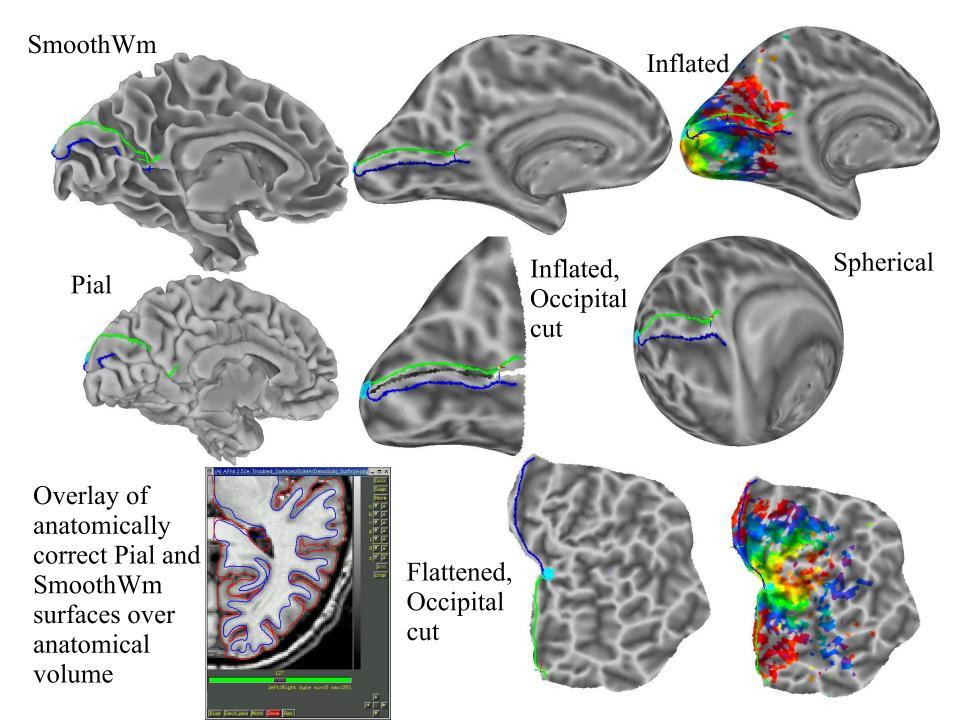

- Surface Geometry:
  - refers to the spatial coordinates of nodes forming a surface model
- Surface Topology:
  - refers to the connectivity between nodes forming a surface model
- A family of surfaces with different geometry but similar topology is created for each surface model.
  - white/grey, pial, inflated, spherical, flattened, etc.
- Some models' geometries are anatomically correct
  - Pial and/or white matter surfaces can be used for relating to volume data.
  - Inflated, flattened and spherical cannot be directly linked to volume data. The link is done via their corresponding anatomically-correct surfaces.
- Those relationships are encoded in the Spec file.

## Geometry and Topology

- Geometry: Spatial location
  - X,Y,Z coordinates of brain structures
- Topology: Spatial connectivity
  - Relative positions of brain structures along the surface

- Geometric proximity does not imply topological proximity
  - If you care about the topology of activation, you should transfer FMRI data onto the surface before spatial manipulations of the data

## Viewing the group of surfaces

- Switch Viewing States:
  - (period) switches to next viewing state (pial then inflated, ...)
  - (comma) switches to previous viewing state
  - Navigate on any of the surfaces and watch AFNI's crosshair track surface
  - SPACE toggles between current state and Mapping
     Reference state
- Viewing multiple states concurrently:
  - ctrl+n opens a new SUMA controller (up to 6 allowed, more possible but ridiculous)
  - switch states in any of the viewers
  - all viewers are still connected to AFNI (if any are)

## Viewing the group of surfaces

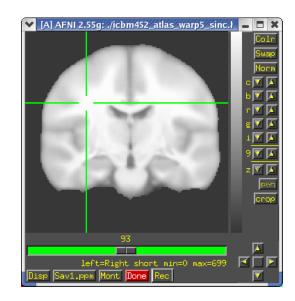

- Controlling link between viewers:
  - Open SUMA controller with ctrl+u or View->SUMA Controller
  - SUMA controller crosshair locking options:
    - '-': no locking
    - 'i': node index locking (i.e., topology based)
    - 'c': node coordinate locking (i.e., geometry based)
  - SUMA controller view point locking
    - 'v': depress toggle button to link view point across viewers.
      - Surface rotation and translation in one viewer is reflected in all linked viewers

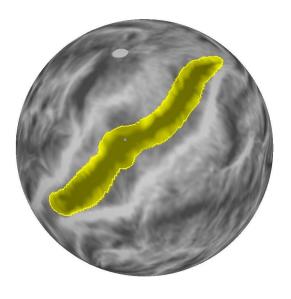

# Standardizing Surfaces For Group Analysis

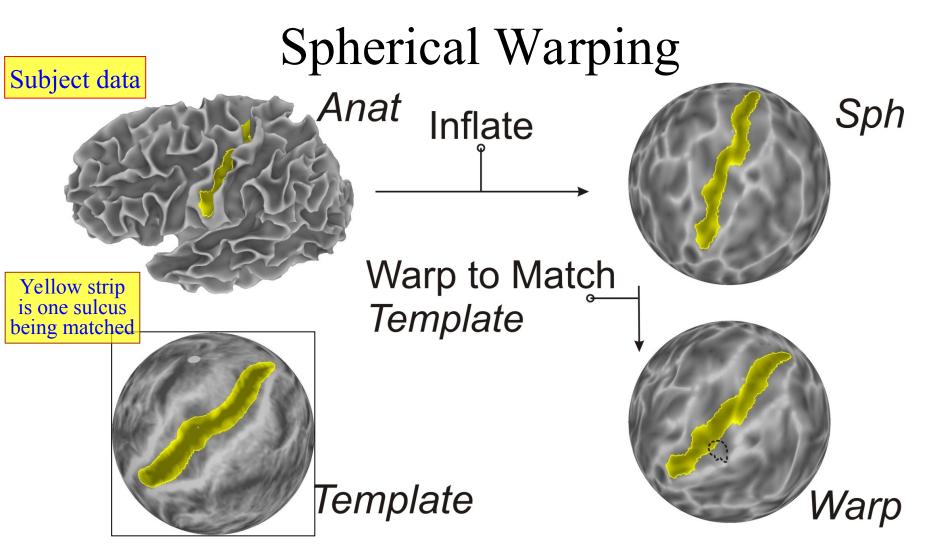

- Now that surfaces have been checked for quality, we will transform them for group analysis
- This step is the equivalent of standard-space normalization for volume-based analysis.
- In volume-based analysis:
  - goal is to have the same voxel spatial location correspond to the same anatomical location in all subjects
- In surface-based analysis
  - goal is to have the same node index correspond to the same anatomical location in all subjects

# Group analysis

- Group analysis requires data defined over a spatial domain common to all subjects
  - Talairach space for volume-based analysis
    - With low order registration
      - + Small amount of geometric distortion
      - No respect for topology of activation
    - With high order registration
      - + Preserves the topology of action
      - Considerable geometric distortion
  - Spherical coordinate system for surface-based analysis
    - + Preserves the topology of activation
    - Considerable geometric distortion
- Preserving the topology of activation is <u>Good</u> in general and crucial for
  - Retinotopy
  - Plasticity
  - High-resolution Mapping

Surface-based warping (based on matching geometrical features like sulci and gyri) is more accurate than the more common low order Talairach volume-based analysis because it preserves the topology of the cortical sheet *and* uses more landmarks for the warping

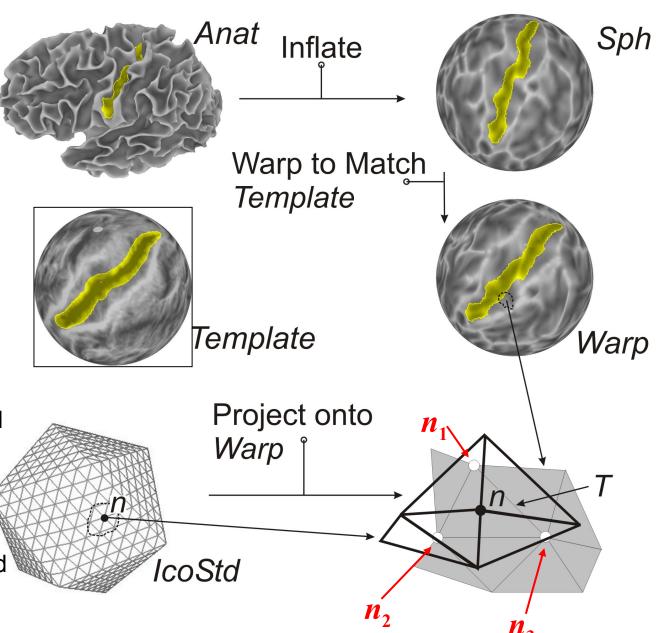

# Mapping data

Problem is that surfaces from different subjects are not topologically isomorphic (different meshes).

#### **One Solution:**

Data from each subject are mapped onto the icosahedral surface for group analysis

Cumbersome and unnecessary second interpolation

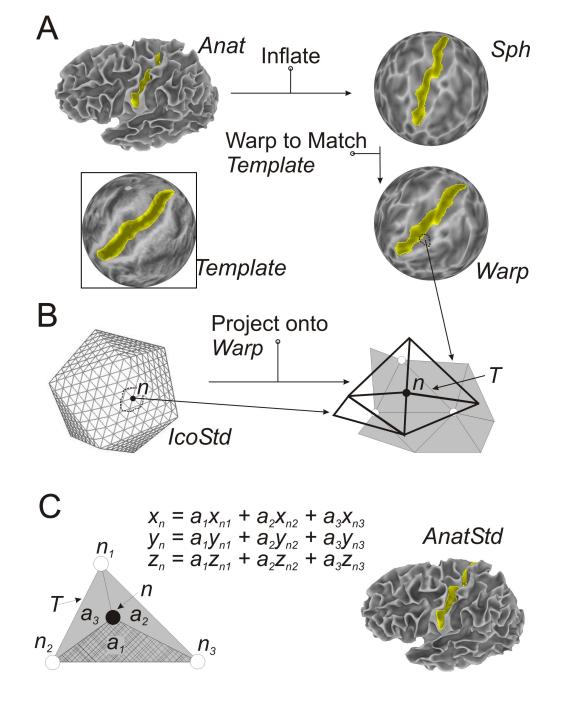

# Our Way

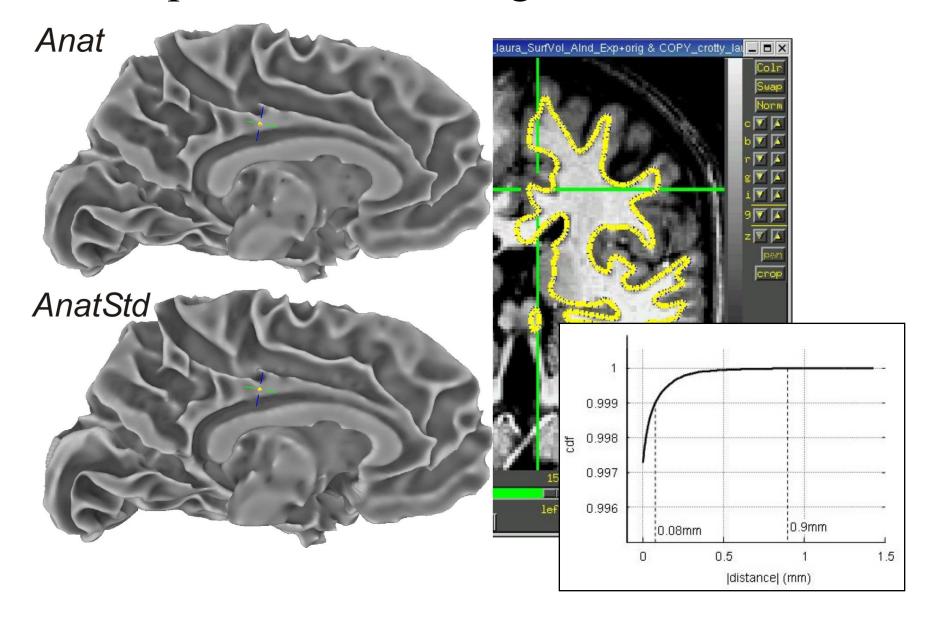

Instead of interpolating data values to the icosahedral nodes, interpolate using the coordinates of the original surface's node.

This results in a new surface that is virtually identical in geometry to the original surface **but** with the mesh of the icosahedron - the same mesh for each subject.

Cross-subject surface based analysis is thus reduced to node-based analysis

# Compare surfaces: Original and Standard

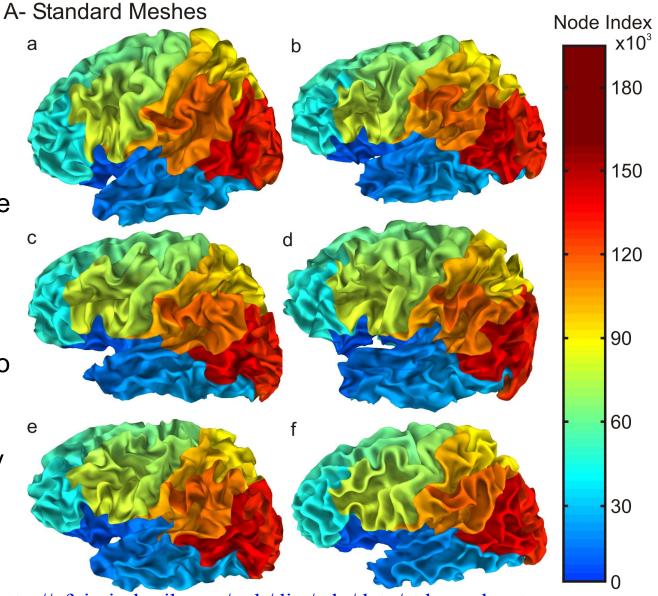

## Standard meshes for 6 subjects

 6 standard-mesh surface models from different subjects.

 Node colors encode for node index n on the standard mesh.

 Nodes with similar indices correspond to comparable sulcal landmarks despite anatomical variability across subjects.

Reproduce figure from http://afni.nimh.nih.gov/pub/dist/edu/data/std\_meshes.tgz with: tcsh run stdmesh demo

- Original-mesh versions of standard-mesh surfaces with same coloration scheme
- Surfaces have differing numbers of nodes, some colors may not be represented
- Nodes with similar indices no longer correspond to comparable anatomical areas
- Small clusters of red color show new nodes later added to correct topological errors

## Creating Standard-Mesh Surfaces

- Required Data:
  - Original Surface models
  - Warped Spherical surface
  - Spec file of the surfaces above (i.e. DemoSubj\_lh.spec)
- Creating the standard-mesh versions of the original surfaces

```
Maplcosahedron -spec Demo_Subj_lh.spec \ Written by B. Argall -ld 141 \ -prefix ld141 \ -spec SpecFile: option specifying spec file with original surfaces -ld n : number of subdivisions for each edge of the icosahedron. Nv = 2 + 10n^2 \qquad (198812 \ vertices)
Nt = 20n^2 \qquad (397620 \ triangles)
Ne = 30n^2 \qquad (596430 \ edges)
```

-prefix: prefix assigned to standard mesh surfaces

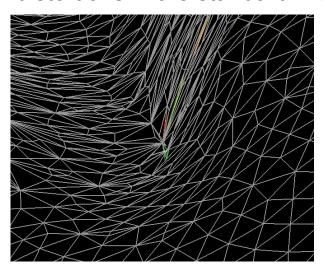

- @SUMA\_Make\_Spec\_FS now generates standard-mesh surfaces by default. See @SUMA\_Make\_Spec\_FS -help for details.
- Script run\_stdmeshes was used to generate standard-mesh surfaces for the hands-on material

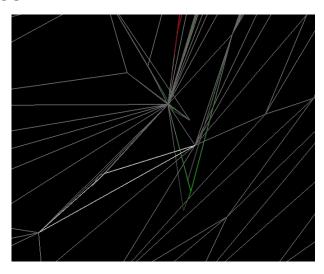

## Using Standard-Mesh Surfaces

- Subsequent analysis will use standard-mesh surfaces, not originals
  - Map single-subject data to corresponding standard-mesh surfaces.
  - Use any of AFNI's 3dXXX voxel-based statistical tools to perform withinand cross-subject analysis in the surface domain
    - 3dXXX programs can read/write NIML-formatted datasets defined over surface domains as well as true 3D volume files
- Creating standard-mesh surfaces takes a couple of minutes per subject
- You can compare original and standard surfaces using:
  - SUMA
    - create a spec file containing both original and standard-mesh surfaces.
    - open two views, one showing original surface and one showing standard-mesh surfaces
    - link viewers by coordinates (not by node index) from the SUMA controller (ctrl+u)
  - CompareSurfaces
     Written by Shruti Japee
    - a program that calculates the distance from each node on surface 1 along its normal to surface 2
  - SurfaceMetrics
    - a program that calculates metrics of the mesh like edge lengths, triangle areas, curvature, etc.

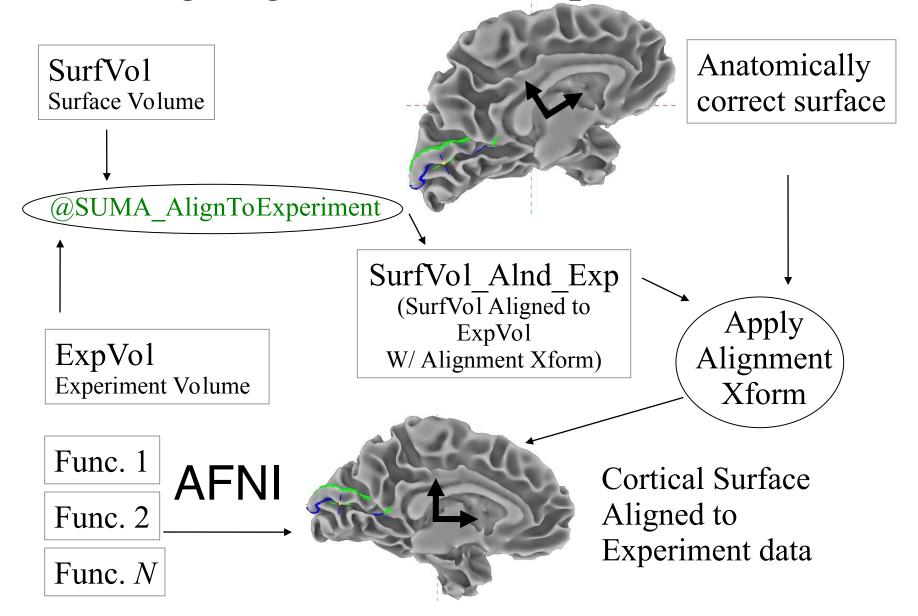

## Artifacts with standard meshes

- In the past, there have been localized distortions between the standard-mesh surface and the original surface.
- These had all been caused by topological errors in the original spherical surfaces.
- SurfQual was written to highlight these errors
  - if causing distortions, errors must be fixed with the program used to generate them.
  - These topological errors can be ignored if they do not cause any visible distortions in the standard-mesh surfaces.

 Distortions in triangle sizes are the dual of compression/stretching on the registered sphere. If distortions are extreme, revisit regularization parameters of the registration procedure.

- Functional data are assumed to be in register with experiment's anatomical
  - Align Anatomical to EPI using: align\_epi\_anat.py.
- Surface Volume is aligned to experiment's anatomical volume with rigid-body or affine transformation
  - The script @SUMA\_AlignToExperiment simplifies this step and rarely fails. If it does, you could try manual registration with 3dTagalign
  - Brain coverage and image types should be comparable, not necessarily identical
- Functional data are not interpolated

- Demo: (close previous SUMA and AFNI sessions)
  - cd suma\_demo/afni
    - DemoSubj\_spgrax+orig (experiment's high-res. anatomical scan)
    - DemoSubj\_EccExpavir+orig & DemoSubj\_EccExpavir.DEL+orig (EPI timeseries and function.)
  - To perform the alignment we ran the SUMA package script:

- This script uses 3dvolreg or 3dAllineate to align the experiment's anatomical volume to the Surface Volume.
- The script takes care of resampling (with 3dresample) the experiment's anatomical volume to match the Surface Volume if need be.
- The output volume is named with the prefix of the Surface Volume with the suffix AInd Exp (read "Aligned to Experiment").

Hand I old se -wd option if exp\_anat has been non-rigidly aligned to the epi

- Launch AFNI to check that volumes aligned well:
  - afni –niml &
    - Switch Underlay to DemoSubj\_SurfVol\_Alnd\_Exp+orig
    - Switch Overlay to DemoSubj\_spgrsa+orig
    - Visually check the alignment:
      - For example, with pointer in slice viewing window:
        - press 'o' on the keyboard to turn off the overlay
        - press 'u' repeatedly to toggle between displaying the two volumes
- ☐ Launch SUMA to check alignment of surface with volumes

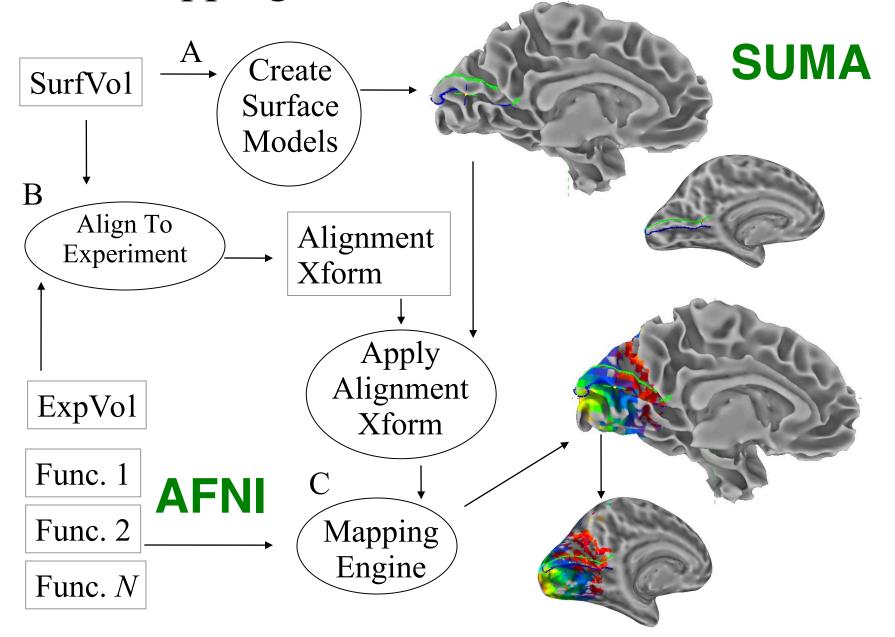

```
suma —spec ../SurfData/SUMA/std.DemoSubj_lh.spec \
-sv DemoSubj_SurfVol_AInd_Exp+orig &
```

or execute the script: *tcsh run\_suma* 

Press 't' to talk to AFNI

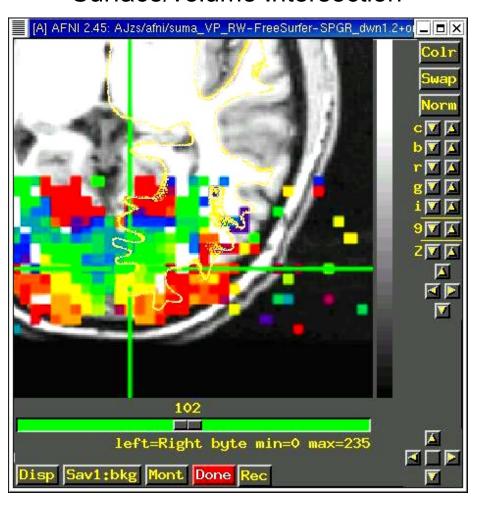

- You should see a surface overlaid onto DemoSubj\_SurfVol\_Alnd\_Exp+orig
- ☐ Alignment should be proper, otherwise you have a problem.

C: Mapping FMRI Data Onto Surface

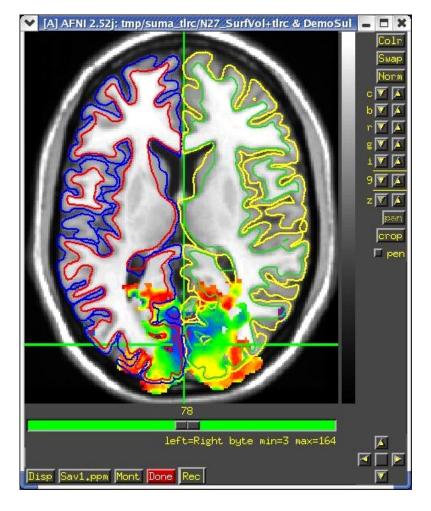

## Mapping Options

Surface/volume Intersection

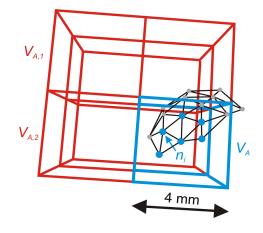

Shell/volume Intersection

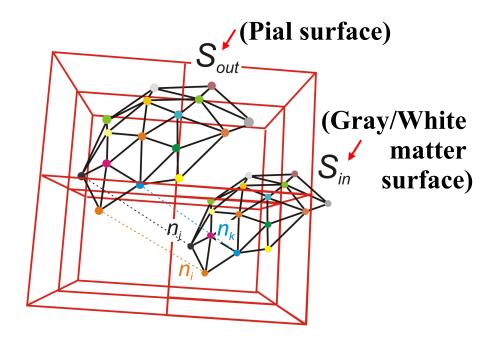

# Mapping options

- Surface/volume Intersection
  - One voxel per node

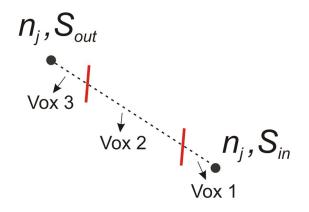

(whatever voxel that node lies inside of)

- Shell/volume Intersection
  - Multiple voxels possible per node

Node segment intersecting 3 voxels

## Mapping Habits

- When mapping data from volume to surface domains
  - If mapping assigns multiple voxels to one node
    - How do you deal with functional datasets?
      - Do you average statistics?
      - Do you apply a threshold before or after averaging?
        - » What if some of the voxels are active and some are not?
    - ☐ These problems are best avoided by:
      - Mapping the time series data onto the surface
      - Performing statistical analysis directly in the surface domain using 3dXXX AFNI programs
- When combining surface data across subjects
  - Same concerns as with volumetric group analysis
- You can also create volumetric data from surface-based data
  - use 3dSurf2Vol, the inverse of 3dVol2Surf

## Interactive Mapping Onto Surface

- Interactive mapping is controlled by AFNI's Vol2Surf plugin
  - Mapping is done using anatomically correct surfaces sent to AFNI with the overlay data volume.
    - See plugin's help for details.
  - Only colors (not data values) are sent from AFNI to SUMA.
- Demo (Continued): To map data from volume to surface interactively:
  - Execute tcsh run\_3dVol2Surf, to ensure you have demo sets.
  - Switch Overlay to DemoSubj\_EccExpavir.DEL
  - Define Overlay with:
    - Olay: Delay
    - Thr: Corr. Coef.
    - Pos. color mapping
    - □ #20 color map
    - See Function
      - You should see the function on the surface model in SUMA.
      - ☐ The colors are applied to all topologically related surfaces
      - □ NOTE: Only AFNI controller A sends function back to SUMA
- Hands-On Change threshold in AFNI and watch change in SUMA

## Command-line Mapping

 3dVol2Surf maps <u>data</u> from a 3D volume dataset directly onto the cortical surface, creating a new dataset defined over a surface

3dVol2Surf

```
../SurfData/SUMA/std.DemoSubj Ih.spec
-spec
-surf_A
            Ih.smoothwm.asc
            Ih.pial.asc
-surf_B
            DemoSubj_SurfVol_AInd_Exp+orig
-SV
-grid_parent
            DemoSubj_EccExpavir.DEL+orig
-map_func
            ave
-f steps
            10
-f_index
            nodes
-out niml
            v2s.lh.DEL.niml.dset
                         Written by Rick Reynolds
(see output of 3dVol2Surf -help for details.)
```

 Execute script tcsh run\_3dVol2Surf to map various types of data onto the surfaces

## Options for 3dVol2Surf example

- Basic Parameters:
  - -spec: SUMA spec file containing surface(s) to be used in mapping.
  - -surf\_A (-surf\_B): Surface(s) to be used in the mapping.
  - -sv: Surface Volume used to align surface to data
  - -grid\_parent: AFNI volume containing data to be mapped.
  - -map\_func: Method for handling voxels to node mapping
  - -out\_niml: Output dataset file in NIML format
- Optional parameters (just a few of them):
  - -cmask: Option for masking data in DataVol on the fly...
  - -oom\_value V0 : Assign V0 to nodes in masked voxels
  - -oob\_value V1: Assign V1 to nodes that are not covered by any voxels
    - -oom\_value and -oob\_value are useful for creating 'full' datasets.

### Format of surface-based datasets

- The output dataset can be thought of as a table of numbers.
  - Each column represents data from one sub-brick in the volume
  - Each row represents the values mapped to a node
    - By default, a surface dataset is 'sparse'; containing only rows for the nodes that had data mapped onto them
    - When combining surface-based datasets, it is safest to work with 'full' datasets which contain a row for each node
    - ConvertDset can turn 'sparse' datasets into 'full' ones.
- Useful tools for manipulating datasets:
  - 3dinfo (Information as viewed by AFNI's 3dXXX progams)
  - SurfDsetInfo (Information as viewed by SUMA)
  - ConvertDset (A tool to convert between formats)
- Selection qualifiers to dataset names

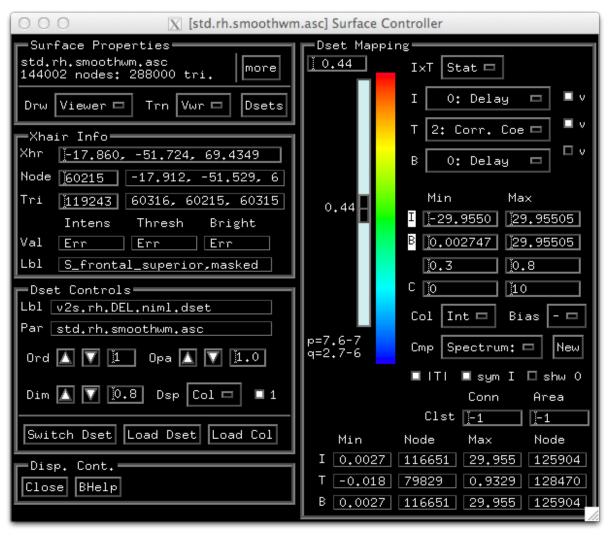

[SEL] to select certain columns (sub-bricks)

**(SEL)** to select certain rows

**#SEL#** to select certain nodes

- The format of SEL is the same as in AFNI, see section 'INPUT DATASET NAMES' in 3dcalc -help for details.
- [i] to select the node index column (NIML dsets only)

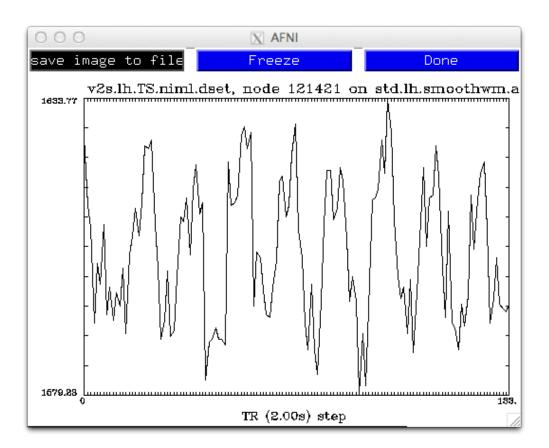

# Colorizing Results Interactively

- Demo (continued):
  - ☐ In SUMA, press 'ctrl+s' to open Object Controller.
    - □ Use View→Object Controller if you were born after 1981.

# **Graphing Time Series**

- Demo (continued):
  - Press "Load Dset" and read in "v2s.lh.TS.niml.dset"
    - Contralateral dataset, if sanely named, gets automatically loaded too
    - In SUMA, press 'g' to graph data points at the selected node
    - Select other nodes (or right-click+drag) to see data at other nodes
    - Press 'Freeze' on graph window to preserve current graph
      - Clicking on other nodes will start a new graph

## Colorizing results interactively

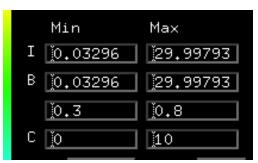

- Demo (continued):
  - Press "Load Dset" and read in "v2s.lh.DEL.niml.dset"
    - SUMA will colorize the loaded Dset (create a color plane for Dset) and display it on the top of pre-existing color planes.
    - We begin by describing the right side block "Dset Mapping" which is used to colorize a Dset. Many of the options mimic those in AFNI's "Define OverLay" controls.
    - Many features are not mentioned here. See online docs. and BHelp.
  - From the Dset Mapping block (right side of interface)
    - Select column Corr. Coef. for Threshold (T)
      - Press 'v' button to apply thresholding
      - Use scale to set the threshold. Nodes whose cross correlation value does not pass the threshold will not get colored
      - □ Note *p* (uncorrected), and *q* values (FDR) below the slider
        - FDR values are per-hemisphere

### Output Description

- For simplicity, we mapped a statistical dataset onto the surface. This resulted in statistical parameters being averaged without being normalized
- A better approach would be to map the time series, and then perform the statistical computation. See script ./run\_3dVol2Surf for examples.

- Demo (continued):
- Mapping Parameters Table:
  - Used for setting the clipping ranges.
  - Clipping is only done for color mapping. Actual data values do not change.
  - Column Min:
    - Minimum clip value. Clips values (v) in the Dset less than Minimum (min): if v < min then v = min</p>
  - Column Max:
    - Maximum clip value. Clips values (v) in the Dset larger than
       Maximum (max): if v > max then v = max
  - Row I
    - Intensity clipping range. Values in the intensity data that are less than Min are colored by the first (bottom) color of the colormap. Values larger than Max are mapped to the top color.
  - Left click on the I locks ranges from automatic resetting when you choose a different dataset column for I
  - Right click on the I resets values to full range in data

Col | Int □

Bias

Spectrum:

- Demo (continued):
- Col:
  - Switch between color mapping modes.
    - *Int*: Interpolate linearly between colors in colormap
    - NN: Use the nearest color in the colormap.
    - Dir: Use intensity values as indices into the colormap. In Dir mode, the intensity clipping range is of no use.

### • Cmp:

- Switch between available color maps. If the number of colormaps is too large for the menu button, right click over the 'Cmp' label and a chooser with a slider bar will appear.
- Alternately, as with many of SUMA's menus, detach the menu by selecting the dashed line at the top of the menu list. Once detached, the menu window can be resized so you can access all elements in very long lists.
- More help is available via ctrl+h while mouse is over the colormap
- Bias: This is mostly for fun shifts node coordinates by the data value

- Demo (continued):
- The Colormap:
  - The colormap is actually a display surface in disguise and shares some of the functions of SUMA's viewers:
    - Keyboard Controls while mouse cursor is over colormap:
      - r : record image of colormap
      - Ctrl+h: a help message for the Dset Mapping block
      - z : Zoom in on colormapMaximum zoom shows 2 colors in the map
      - Z : Zoom out on colormapMinimum zoom shows all colors in the map
      - Up/Down arrows : rotate colormap up/down.
      - Home: Reset zoom and translation parameters
    - Mouse Controls
      - None yet, some maybe coming someday

- Demo (continued):
- |T|:
  - Toggle Absolute thresholding.
    - OFF: Hide node color for nodes 'n' that have:
      - T(n) < Tscale
    - ON: Hide node color for nodes that have:
      - |T(n)| < Tscale
  - where: Tscale is the value set by the threshold scale.
    - T(n) is the value in the selected threshold column (T).

□ ITI □ sym I □ shw 0

### • sym l:

- Toggle Intensity range symmetry about 0.
  - ON: Intensity clipping range is forced to go from -val to val. This allows you to mimic AFNI's color ranging mode.
  - OFF: Intensity clipping range can be changed to your liking.

### • shw 0:

- □ Toggle color hiding of nodes with intensity = 0
  - ON: 0 intensities are mapped to the colormap as any other values.
  - OFF: 0 intensities are hidden, a là AFNI

• Demo (continued):

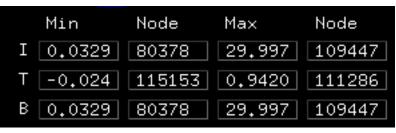

### Interactive Clustering:

- Left click on 'Clst' to activate/deactivate. Cluster table is output to shell. Clicking on a node shows its cluster label in the viewer.
- Conn: Minimum distance between nodes in the same cluster
  - Default is in mm (units of the surface coords). Negative values specify distance in number of edges between nodes.
- Area: Minimum area () criterion for accepting a cluster.
  - Default area units are in mm². Negative numbers indicate masking by node number rather than area.

#### • Data Range Table:

- Full range of values in Dset.
  - Right click in "Node" columns to have crosshairs ju
    - You might have to move the surface around jumped

### Xhair Info block

Demo (continued):

### • Xhr:

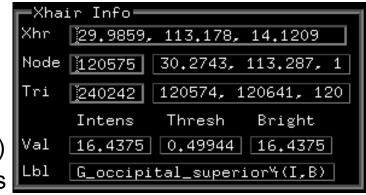

- Crosshair coordinates on this controller's surface. Entering new coordinates makes the crosshair jump to that location (like 'ctrl+j').
  - ☐ Use 'alt+1' (that's a lower-case 'ell') to center crosshairs in your viewer.

### Node:

Node index of node in focus on this controller's surface. Nodes in focus are highlighted by the blue sphere in the crosshair. Entering a new node's index will put that node in focus and send the crosshair to its location (like 'j').

### Node Values Table:

- Data Values at node in focus
  - □ Column *Intens*: Intensity (I) value
  - □ Column *Thresh*: Threshold (T) value
  - ☐ Column *Bright*: Brightness modulation (B)
  - □ Row *Val*: Data Values at node in focus

### Node Label Table:

- Row Lb!:
  - Labels available at the node in focus. Labels include FreeSurfer's parcellations, intensity, threshold, and brightness values, cluster membership, etc. You're better off reading the label from the viewer.

Hands-On

## Dset Controls block

- Demo (Continued):
- Dset Info Table:
  - □ Row **Lbl**: Label of Dset.
  - Row Par: Parent surface of Dset.

### • Ord:

Order of Dset's colorplane. Dset with highest number is on top of the stack. Separate stacks exits for foreground (fg:) and background planes (bg:).

### • Opa:

- Opacity of Dset's colorplane. Opaque planes have an opacity of 1, transparent planes have an opacity of 0. Opacities are used when mixing planes within the same stack foreground (fg:) or background (bg:).
- Opacity values are not applied to the first plane in a group. Consequently, if you have just one plane to work with, opacity value is meaningless.
- Color mixing can be done in two ways, use F7 to toggle between mixing modes.

## Dset Controls block

• Demo (Continued):

### • Dim:

- Dimming factor to apply to colormap before mapping the intensity (I) data. The colormap, if displayed on the right, is not visibly affected by
   Dim but the colors mapped onto the surface are.
- ☐ For RGB Dsets (.col files), Dim is applied to the RGB colors directly.

### • Dsp:

How to display node color values. Options include pseudocoloring, contouring (at discrete color levels), both, or none.

### • 1: (for 1 only)

- If ON, view only the selected Dset's colors. No mixing of colors in the foreground stack is done.
- If OFF, mix the color planes in the foreground stack.
- This option makes it easy to view one Dset's colors at a time without having to worry about color mixing, opacity, and stacking order.
- Hands-On Needless to say, options such as 'Ord:' and 'Opa:' in this panel are of little use when this button is ON.

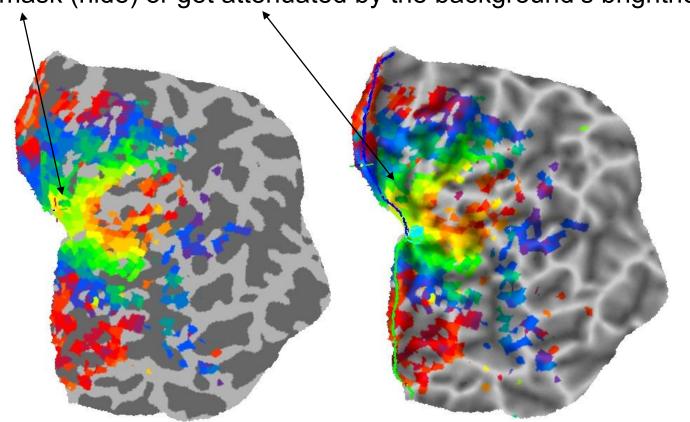

## Color overlay planes

- Colorized Dsets are organized into layered color planes
  - 2 commonly used planes are:
    - Surface Convexity (usually in gray scale)
    - AFNI Function (usually in color)
  - Planes are assigned to two groups
    - Background planes (like Convexity)
    - Foreground planes (like AFNI Function)
  - Many other planes can be added to either group.
- Color planes of the same group are mixed together:
  - Planes are stacked based on their order and opacity.
  - Opacity of 1st plane in a group does not affect color mixing.
  - ☐ There are 2 modes for mixing colors. See F7 key in SUMA.

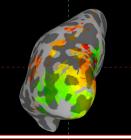

## Color overlay planes

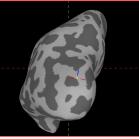

- Node colors displayed on surface are obtained by:
  - ☐ 1<sup>st</sup>: mixing background planes
  - ☐ 2<sup>nd</sup>: mixing foreground planes
  - ☐ 3<sup>rd</sup>: layering mixed foreground atop mixed background plane
    - When foreground colors overlap background colors, they either mask (hide) or get attenuated by the background's brightness.

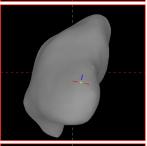

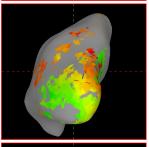

# Layering fore- & background planes

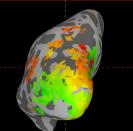

- Demo (continued):
  - View an inflated surface with function from AFNI
  - Turn foreground plane(s) off by pressing 'f' once
    - Now all you see is the background plane(s)
  - □ Turn background planes off by pressing 'b' once -
    - Now all you see is "No Color" color on all nodes
  - □ Turn foreground plane(s) back on with 'f' ←
    - Now you have foreground without background
  - Turn background plane(s) back on with 'b'
    - Now you have foreground atop background
    - You can still see the background underneath the foreground—this is due to the background brightness attenuation of the foreground colors.
  - □ Toggle background intensity attenuation off and on with 'a' and see the effect on the resultant maps. ←

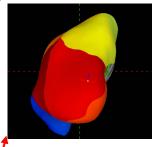

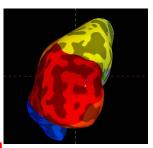

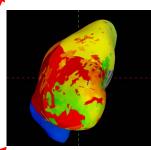

# Playing with color plane opacity

- Demo (continue from inflated view with function)
  - □ 'ctrl+s' or View→Object Controller to open surface controller
    - Turn OFF '1 Only'
  - Load in color plane lh.1D.col with 'Load Col' or 'c'
    - This is an RGB Dset, color mapping controls are hidden
    - Plane is placed atop of the foreground group
    - Its opacity is 1 so it will obscure the functional data
    - Background attenuation is not affected by plane's opacity.
      - ☐ try turning it on and off again with 'a'
    - Now lower the opacity of lh.1D.col with Opa: and watch the

colors from the planes below start to show through

Lbl v2s.lh.DEL.niml.dset Par std.lh.smoothwm.asc

Ора 🛕

[0.8 Dsp Col □

Switch Dset Load Dset Load Col

## Playing with color plane order

- Demo (continue from inflated view with function)
  - You could put Ih.1D.col below the function
    - Switch Dset to get a list of available planes
    - Prefixes fg: and bg: denote plane's group membership
    - Select Ih.1D.col and lower its order with the Ord: button
    - Select FuncAfni\_0 and play with its opacity
    - Note: You can't make a plane change its group membership, yet.
  - You can't delete a loaded color plane yet, but you can hide it.
  - Turn '1' ON if you just want to see the selected plane.
    - The one whose label is shown in the object controller

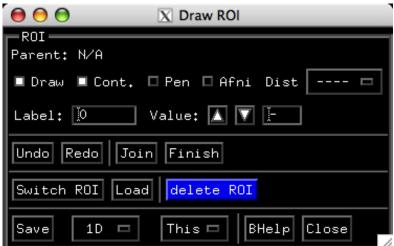

#### Test!

- Find a way to flip between the mapping from AFNI and the mapping done with 3dVol2Surf before.
  - Appreciate the differences between the two mappings.

## Drawing surface-based ROIs

- Demo
  - ☐ 'Ctrl+d' or Tools→Draw ROI to open ROI drawing tool
    - ☐ When in Draw ROI mode (cursor turns into target circles) ☐ □
      - The pick (usually third) mouse button is used for drawing
      - Picking is done by combining shift key and pick button
    - ☐ If pen mode is selected (cursor turns into a pen)
      - ☐ Drawing and picking (with shift) are done with the 1<sup>st</sup> mouse button and rotations are done with the third button
  - When you draw for the first time, a new "drawn ROI" is created.
    - Note the Parent: field in the ROI frame gets filled when you draw

## Drawing surface-based ROIs

### Demo

- Move the mouse to a new location and click again to draw a line from the location of the first click to a new one.
- Or click while dragging the mouse to create a smoother line.
- Both drawing methods might fail if you are drawing over very rough terrain.
  - When that happens, you continue from where the drawing stopped.
  - Drawing in 3D looks easy but it isn't.
- Use Undo and Redo when you get your drawings messed up.
- To close a loop you can press 'Join' button or double click

## Drawing surface-based ROIs

- Demo (Continued)
  - ☐ To fill a closed loop, click inside the loop.
    - Note: If you have patterns that make a figure 8 jealous you might have to do multiple fills.
  - Press Finish when you are done drawing and have set the drawing label and value to your liking.
  - Now you can draw another ROI, and another and another.
  - Drawing can be started/continued on any of the related surfaces
    - When you hit 'Join', the loop is closed using the surface where the ROI was created
  - Switch ROI to switch between ROIs and delete/modify them.
  - Load to load ROIs from file
  - Save to save ROIs to file
    - □ 1D or NIML = Format of ROI file
    - This or All = which ROI to save into the file

## Surface ROI → Volume ROI

- ROIs files should be transformed to dataset files (Dset).
  - A dataset file has an equal number of values for each node
  - You can draw two ROIs, such that some nodes belong to more than one ROI (i.e., they have more than one value)
- The program ROI2dataset is used to change ROIs to datasets
- Execute: tcsh run\_ROI2dataset

```
ROI2dataset -label_dset lh.OccROIs.niml.dset -input lh.OccROIs.niml.roi
```

Note the warning:

```
Warning SUMA_ROIv2dataset: 155/2536 nodes had duplicate entries. (ie same node part of more than 1 ROI) Duplicate entries were eliminated.
```

At the moment, duplicate entries are ignored, 1<sup>st</sup> come, 1<sup>st</sup> adopted. More options could be added if truly necessary.

## Surface ROI → Volume ROI

- Ih.OccROIs.1D.dset (created on the previous slide) can be transformed into a volume ROI with 3dSurf2Vol
- Execute: source run\_3dSurf2Vol

-grid\_parent specifies the output volume's geometric properties

-f\_p1\_mm, -f\_pn\_fr: Specify extensions on node pair segment, either in mm or fractions of segment length (both used simultaneously here for illustration)

-sdata\_1D: Specify surface data file

## Surface ROI Utilities

### SurfPatch

- Takes ROIs on a surface and form a new surface using the ROI nodes only
- Compute volume of a patch/ROI if you have two bounding surfaces

### SurfMeasures

 Produce surface derived measurements that are node based such as the volume attributed to a node, etc.

### SurfaceMetrics

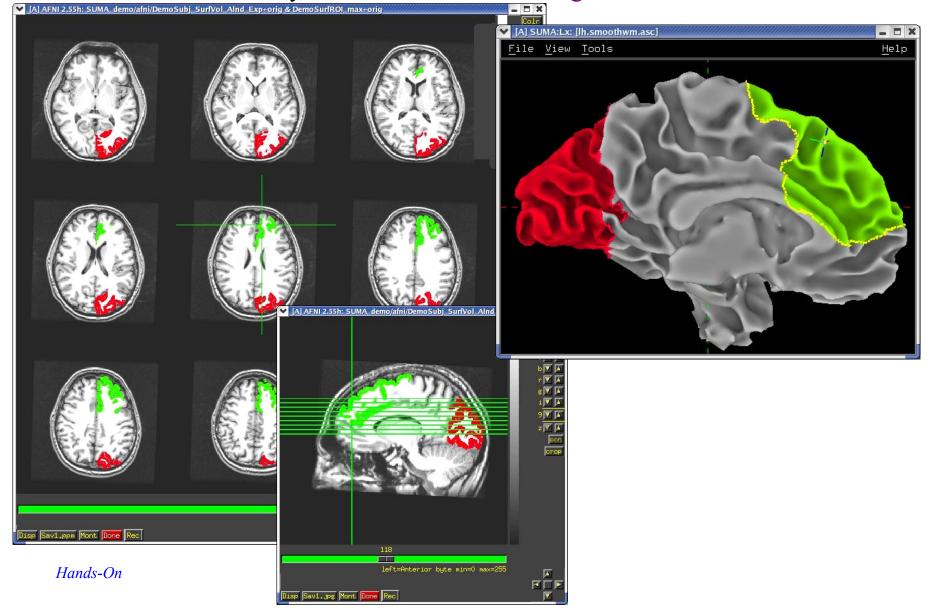

Also produce surface derived measurements that are node based

### ConvertSurface

Surface format and coordinate transformations including projections

## Surface ROI → Volume ROI

check your own lh.OccROIs+orig in AFNI

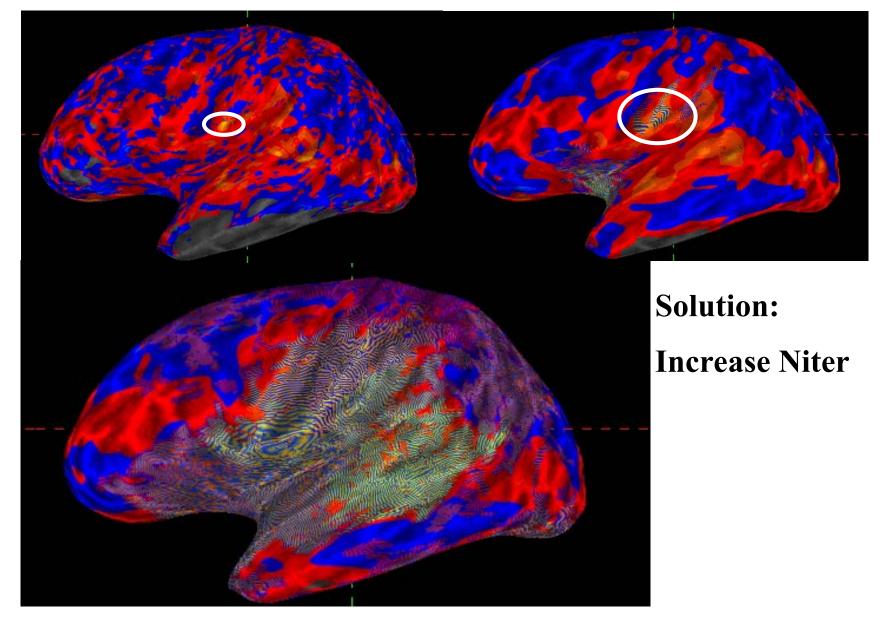

# Smoothing data on surface models

- Data smoothing (along the surface) is done with SurfSmooth
  - The difficulty in smoothing lies in calculating geodesic distances between node pairs.
  - Smoothing can be performed by solving the diffusion equation on the surface. However effect of the kernel is is somewhat poorly estimated. Number of iterations needed is a wild guess with numerical accuracy issues. Better smooth until a certain smoothness is reached.
  - SurfSmooth can estimate smoothness
    - until desired smoothness is reached
    - or until additional smoothness is achieved
- Demo (close SUMA and afni)

Hands-On

- Execute: tcsh run\_SurfSmooth\_data
  - The script will use the output of 3dVol2Surf in run\_3dVol2Surf to map timeseries data onto the surfaces
  - SUMA is then launched and the script waits for you to setup the recorder ON with 'R'
  - Hit Enter twice (in the shell) to launch the smoothing program
  - Watch the smoothing progress with each iteration. You can play the whole sequence at the end.

### Look At Your Data!

# Smoothing geometry of surface

- Surface geometry smoothing can also be done with SurfSmooth
  - The difficulty in geometry smoothing is in preventing the surface from shrinking in size.
  - SurfSmooth uses the smoothing algorithm by (Taubin G. 2000)
- Demo (close SUMA and AFNI)
  - Execute: tcsh run\_SurfSmooth\_geom
    - The script will add noise to the smoothwm surface, then filter it
    - SUMA is then launched and the script waits for you to setup
      - ☐ Turn off background colors ('b')
      - ☐ Switch to noisy surface ('.')
      - ☐ Turn recorder ON ('R')
    - Hit Enter twice (in the shell) to launch the smoothing program
    - Watch the smoothing progress with each iteration. You can play the whole sequence at the end (e.g., with the 'v' key in the image viewer window)

## Talairach or MNI data display, for panache

- Without creating individualized surfaces, you can display data on a Talairach-ed or MNI-ed surface model.
  - ☐ The surface models were created with FreeSurfer from the N27 dataset. (Holmes, CJ et al. JCAT 1998)
  - Surfaces were created from AFNI's TT\_N27+tlrc and MNI\_caez\_N27+tlrc, for Talairach and MNI versions, respectively.
- Demo: (close previous SUMA and AFNI sessions)
  - If you need suma\_TT\_N27/ download and unpack: http://afni.nimh.nih.gov/pub/dist/tgz/suma\_TT\_N27.tgz tar xvzf suma\_TT\_N27.tgz
  - □ cd AFNI\_data6/group\_results

□You should find FT\_anat+tlrc and a functional datasets in Talairach space

□ afni –niml &

Isetup function as shown in the earlier slides

```
suma –spec ~/suma_TT_N27/TT_N27_both.spec \
-novolreg –sv FT_anat+tlrc
```

**Istart communication with AFNI** 

Imap function onto surface

• appreciate the geometric limitations of this approach

Dignore the limitation and make cool pictures

## **Processing Pipelines**

### afni\_proc.py

- With a couple of extra options (-spec and -sv), afni\_proc.py can process single-subject data in the surface domain.
  - This includes surface-based smoothing and regresion analysis.
    - See example 8 in afni\_proc.py -help
  - All voxel wise programs will work with surface-based data
  - Level-II (group) analysis programs are applicable to surface-based results.
    - 3dcalc, 3dROIstats, 3dMEMA, 3dLME, 3dMVM, etc.

### @RetinoProc

 Process retinotopic data, see @RetinoProc –help for detail including test data

# Demos/Autmaginations

- @DO.examples
- @DriveSuma
- @RetinoProc
- @Install\_TSrestMovieDemo
- @Install\_AfniRetinoDemo
- @Install\_InstaCorr\_Demo

# Auxiliary programs

- To see a list of all programs in SUMA:
  - suma –progs
- 3dSurf2Vol (by R. Reynolds)
  - Maps data in surface domain volumetric domain
- 3dVol2Surf (by R. Reynolds)
  - Maps data in volume domain to surface domain
- CompareSurfaces (by S. Japee)
  - calculates the distance along the normal from one surface to the next
- ConvertSurface
  - Converts surfaces between the different formats that SUMA can read:
    - FreeSurfer
    - SureFit
    - Simple ASCII matrix format
    - PLY format
    - ☐ GIFTI (XML-based) format
  - Converts surface coordinates to Talairach space
- ConvexHull
  - Finds the convex hull of a volume or a set of points

# Auxiliary programs

- Createlcosahedron (by B. Argall)
  - Creates Icosahedral meshes of varying node counts
- inspec
  - Outputs information about a spec file
- IsoSurface
  - Creates an isosurface from a volumetric dataset
- MakeColorMap
  - Creates colormaps for use with AFNI
- MapIcosahedron (by B. Argall)
  - transforms the topology of surface models to standard models without distorting the geometry (tested with FreeSurfer's spherical mapping).
  - use to check for errors in topology of spherical surfaces
- quickspec
  - Creates a spec file for one or a set of surfaces (quick and dirty)
- ROI2dataset
  - Transforms ROI files into surface datasets

# Auxiliary programs

### ScaleToMap

 Transforms a set of node values to node colors based on chosen color map

### SurfaceMetrics

 Outputs other information about the surface such as the edge list, curvature, triangle areas (mostly for debugging use)

### SurfClust

- Clustering on the surface
- SurfMeasures (by R. Reynolds)
  - Outputs node-based surface measures such as areas, volumes, thickness, surface normals, etc. etc.

### SurfSmooth

a program for filtering surface data and/or surface geometry

#### SurfPatch

Creates surface patches from a set of nodes.

### SurfQual

Locates topological errors in spherical surfaces.

# Getting Helped

- suma –help for SUMA's command line usage
- 'ctrl+h' opens a window with help for:
  - SUMA's usage when cursor is in viewer
  - SUMA's colormap usage when cursor is over colormap
- BHelp provides help for most buttons in the GUI interface
- AFNI's web site:
  - http://afni.nimh.nih.gov/
  - http://afni.nimh.nih.gov/afni/community/board
- AFNI's Message Board
- E-mail to saadz@mail.nih.gov
- If you can't get help here, please get help somewhere.

### Tracts in SUMA

Tracts are generated by AFNI's FATCAT toolbox

**FATCAT**: Functional And Tractographic Connectivity Analysis Toolbox (Taylor & Saad, 2013)
